

1 Overview

The learning objective of this lab is for students to get familiar with the concepts in the secret-key encryption. After finishing the lab, students should be able to gain a first-hand experience on encryption algorithms, encryption modes, and initial vector (IV). Moreover, students will be able to use tools and write programs to encrypt/decrypt messages. This lab covers the following topics:

- Secret-key encryption
- Substitution cipher and frequency analysis
- Encryption modes, IV, and paddings
- Common mistakes in using encryption algorithms
- Programming using the crypto library

1 概述

本实验的学习目标是让学生熟悉密钥加密中的概念。完成实验后，学生应该能够获得有关加密算法、加密模式和初始向量（IV）的第一手经验。此外，学生将能够使用工具和编写程序来加密/解密消息。本实验涵盖以下主题：

- 秘钥加密
- 替换密码和频率分析
- 加密模式、IV 和填充
- 使用加密算法的常见错误
- 使用加密库编程

2 Lab Tasks

2.1 Task 1: Frequency Analysis 任务1

It is well-known that monoalphabetic substitution cipher (also known as monoalphabetic cipher) is not secure, because it can be subjected to frequency analysis. In this lab, you are given a cipher-text that is encrypted using a monoalphabetic cipher; namely, each letter in the original text is replaced by another letter, where the replacement does not vary (i.e., a letter is always replaced by the same letter during the encryption). Your job is to find out the original text using frequency analysis. It is known that the original text is an English article.

众所周知，单字母替代密码（也称为单字母密码）不是安全的，因为它可以进行频率分析。在本实验中，您将获得使用单字母密码加密的密文；即，原始文本中的每个字母都被另一个字母替换，其中替换没有变化（即，在加密过程中，一个字母总是被同一个字母替换）。你的工作是使用频率分析找出原文。据了解，原文是一篇英文文章。

Your job is to use the frequency analysis to figure out the encryption key and the original plaintext given a ciphertext (`ciphertext.txt`). The file `ciphertext.txt` can be download from the course Blackboard .

您的工作是使用频率分析找出加密密钥和给定密文 (`ciphertext.txt`) 的原始明文。文件 `ciphertext.txt` 可以从课程 Blackboard 下载。

Guidelines. Using the frequency analysis, you can find out the plaintext for some of the characters quite easily. For those characters, you may want to change them back to its plaintext, as you may be able to get more clues. It is better to use capital letters for plaintext, so for the same letter, we know which is plaintext and which is ciphertext. You can use the `tr` command to do this. For example, in the following, we replace letters a, e, and t in `in.txt` with letters X, G, E, respectively; the results are saved in `out.txt` .

使用频率分析，您可以很容易地找出某些字符的明文。对于这些字符，您可能希望将它们改回纯文本，因为您可能会获得更多线索。明文最好用大写字母，这样对于同一个字母，我们就知道哪个是明文，哪个是密文。您可以使用 `tr` 命令来执行此操作。例如，下面我们将 `in.txt` 中的字母 `a`、`e`、`t` 分别替换为字母 `X`、`G`、`E`；结果保存在 `out.txt` 中。

```
$ tr 'aet' 'XGE' < in.txt > out.txt
```

There are many online resources that you can use. We list four useful links in the following:

- <http://www.richkni.co.uk/php/crypta/freq.php> : This website can produce the statistics from a ciphertext, including the single-letter frequencies, bigram frequencies (2-letter sequence), and trigram frequencies (3-letter sequence), etc.
- https://en.wikipedia.org/wiki/Frequency_analysis: This Wikipedia page provides frequencies for a typical English plaintext.
- <https://en.wikipedia.org/wiki/Bigram>: Bigram frequency.
- <https://en.wikipedia.org/wiki/Trigram>: Trigram frequency.

¹Credit: Wenliang Du, Syracuse University

1

2.2 Task 2: Encryption using Different Ciphers and Modes 任务2

In this task, we will play with various encryption algorithms and modes. You can use the following `openssl enc` command to encrypt/decrypt a file. To see the manuals, you can type `man openssl` and `man enc`.

在此任务中，我们将使用各种加密算法和模式。您可以使用以下 `openssl enc` 命令来加密/解密文件。要查看手册，您可以输入 `man openssl` 和 `man enc`。

```
$ openssl enc ciphertype -e -in plain.txt -out cipher.bin \
-K 00010203040506070809aabbccddeeff \
-iv 0a0b0c0d0e0f010203040506070809
```

Please replace the `ciphertype` with a specific cipher type, such as `-aes-128-cbc`, `-aes-128-cfb`, `-bf-cbc`, etc. In this task, you should try at least 3 different ciphers and three different modes. You can find the meaning of the command-line options and all the supported cipher types by typing `man enc`. We include some common options for the `openssl enc` command in the following:

请将 `ciphertype` 替换为特定的密码类型，例如 `-aes-128-cbc`、`-aes-128-cfb`、`-bf-cbc` 等。在此任务中，您应该尝试至少 3 种不同的密码和三种不同的模式。您可以通过键入 `man enc` 找到命令行选项和所有支持的密码类型的含义。我们在以下内容中包含了 `openssl enc` 命令的一些常用选项：

```
-in <file> input file
-out <file> output file
-e encrypt
-d decrypt
-K/-iv key/iv in hex is the next argument
-[pP] print the iv/key (then exit if -P)
```

- To create a plaintext file, e.g., `plain.txt`, you can the following commands:
- 要创建纯文本文件，例如，`plain.txt`，您可以使用以下命令：

```
$ touch plain.txt
$ gedit plain.txt
```

- Since we did not cover the Cipher Feedback (CFB) and the Output Feedback (OFB) in class, you need to read [Block cipher mode of operation](#).
- To observe the encrypted contents of a file, e.g., `cipher.bin`, in hexadecimal format, use the command line hex viewing tool `xxd`.
- 由于我们在课堂上没有介绍密码反馈 (CFB) 和输出反馈 (OFB)，您需要阅读分组密码操作模式。
- 要以十六进制格式观察文件的加密内容，例如 `cipher.bin`，请使用命令行十六进制查看工具 `xxd`。

```
$ xxd cipher.bin
```

2.3 Task 3: Encryption Mode – ECB vs. CBC 任务3

The file `pic original.bmp` can be downloaded from course Blackboard, and it contains a simple picture. We would like to encrypt this picture, so people without the encryption keys cannot know what is in the picture. Please encrypt the file using the ECB (Electronic Code Book) and CBC (Cipher Block Chaining) modes, and then do the following:

文件 `pic original.bmp` 可以从 course Blackboard 下载，其中包含一个简单的图片。我们想加密这张图片，所以没有加密密钥的人无法知道图片中的内容。请使用 ECB（电子密码本）和 CBC（密码块链）模式加密文件，然后执行以下操作：

1. Let us treat the encrypted picture as a picture, and use a picture viewing software to display it. However, For the `.bmp` file, the first 54 bytes contain the header information about the picture, we have to set it correctly, so the encrypted file can be treated as a legitimate `.bmp` file. We will replace the header of the encrypted picture with that of the original picture. You can use Bless a hex editor tool (already installed on our VM) to directly modify binary files. We can also use the following commands to get the header from `p1.bmp`, the data from `p2.bmp` (from offset 55 to the end of the file), and then combine the header and data together into a new file.

- 1、我们把加密后的图片当成图片，用图片查看软件来显示。但是，对于**.bmp**文件，前54个字节包含图片的头信息，我们必须正确设置，这样加密后的文件才能被视为合法的**.bmp**文件。我们将加密图片的头部替换为原始图片的头部。您可以使用 Bless 十六进制编辑器工具（已安装在我们的 VM 上）直接修改二进制文件。我们也可以使用以下命令从 `p1.bmp` 中获取头部，从 `p2.bmp` 中获取数据（从偏移量 55 到文件末尾），然后将头部和数据合并到一个新文件中。

```
$ head -c 54 p1.bmp > header
$ tail -c +55 p2.bmp > body
$ cat header body > new.bmp
```

2. Display the encrypted picture using a picture viewing program (we have installed an image viewer program called `eog` on our VM). Can you derive any useful information about the original picture from the encrypted picture? Please explain your observations.

2.3.1 Select a picture of your choice, repeat the experiment above, and report your observations.

2.使用图片查看程序（我们在我们的VM上安装了一个名为eog的图像查看程序）显示加密的图片。你能从加密的图片中推导出任何关于原始图片的有用信息吗？请解释你的观察。

2.3.1 选择一张你喜欢的图片，重复上面的实验，并报告你的观察结果。

2.4 Task 4 : Padding 任务4

For block ciphers, when the size of a plaintext is not a multiple of the block size, padding may be required. All the block ciphers normally use PKCS#5 padding, which is known as standard block padding. We will

conduct the following experiments to understand how this type of padding works:

对于块密码，当明文的大小不是块大小的倍数时，可能需要填充。所有块密码通常使用 PKCS#5 填充，这被称为标准块填充。我们将进行以下实验以了解这种类型的填充是如何工作的：

1. Use ECB, CBC, CFB, and OFB modes to encrypt a file (you can pick any cipher). Please report which modes have paddings and which ones do not. For those that do not need paddings, please explain why.
1. 使用 ECB、CBC、CFB 和 OFB 模式加密文件（您可以选择任何密码）。请报告哪些模式有填充，哪些没有。对于那些不需要填充的，请解释原因。
2. Let us create three files, which contain 5 bytes, 10 bytes, and 16 bytes, respectively. We can use the following `echo -n` command to create such files. The following example creates a file `f1.txt` with length 5 (without the `-n` option, the length will be 6, because a newline character will be added by `echo`):
2. 让我们创建三个文件，分别包含 5 个字节、10 个字节和 16 个字节。我们可以使用以下 `echo -n` 命令来创建此类文件。以下示例创建一个长度为 5 的文件 `f1.txt`（没有 `-n` 选项，长度将为 6，因为 `echo` 将添加一个换行符）：

```
$ echo -n "12345" > f1.txt
```

We then use `openssl enc -aes-128-cbc -e` to encrypt these three files using 128-bit AES with CBC mode. Please describe the size of the encrypted files.

然后我们使用 `openssl enc -aes-128-cbc -e` 使用 128 位 AES 和 CBC 模式加密这三个文件。请描述加密文件的大小。

We would like to see what is added to the padding during the encryption. To achieve this goal, we will decrypt these files using `openssl enc -aes-128-cbc -d`. Unfortunately, decryption by default will automatically remove the padding, making it impossible for us to see the padding. However, the command does have an option called `-nopad`, which disables the padding, i.e., during the decryption, the command will not remove the padded data. Therefore, by looking at the decrypted data, we can see what data are used in the padding. Please use this technique to figure out what paddings are added to the three files.

我们想看看在加密期间添加到填充中的内容。为了实现这一目标，我们将使用 `openssl enc -aes-128-cbc -d` 解密这些文件。不幸的是，默认情况下解密会自动删除填充，使我们无法看到填充。但是，该命令确实有一个名为 `-nopad` 的选项，它禁用填充，即在解密期间，该命令不会删除填充的数据。因此，通过查看解密后的数据，我们可以看到填充中使用了哪些数据。请使用此技术找出三个文件中添加了哪些填充。

It should be noted that padding data may not be printable, so you need to use a hex tool to display the content. The following example shows how to display a file in the hex format:

需要注意的是padding数据可能无法打印，所以需要使用hex工具来显示内容。以下示例显示如何以十六进制格式显示文件：

```
$ hexdump -C p1.txt
00000000 31 32 33 34 35 36 37 38 39 49 4a 4b 4c 0a. |123456789IJKL.|
$ xxd p1.txt
00000000: 3132 3334 3536 3738 3949 4a4b 4c0a. 123456789IJKL.
```

2.5 Task 5: Error Propagation – Corrupted Cipher Text 任务5

To understand the error propagation property of various encryption modes, we would like to do the following exercise:

1. Create a text file that is at least 1000 bytes long.
2. Encrypt the file using the AES-128 cipher.

3. Unfortunately, a single bit of the 55th byte in the encrypted file got corrupted. You can achieve this corruption using the `bleess` hex editor.

4. Decrypt the corrupted ciphertext file using the correct key and IV.

Please answer the following question: How much information can you recover by decrypting the corrupted file, if the encryption mode is ECB, CBC, CFB, or OFB, respectively? Please answer this question before you conduct this task, and then find out whether your answer is correct or wrong after you finish this task. Please provide justification.

为了解各种加密模式的错误传播特性，我们想做以下练习：

1. 创建一个至少 1000 字节长的文本文件。

2. 使用 AES-128 密码加密文件。

3. 不幸的是，加密文件中第 55 个字节的一个位被破坏了。您可以使用 `bleess` hex 编辑器实现此损坏。

4. 使用正确的密钥和 IV 解密损坏的密文文件。

请回答以下问题：如果加密模式分别为 ECB、CBC、CFB 或 OFB，解密损坏的文件可以恢复多少信息？请在执行此任务之前回答此问题，然后在完成此任务后查看您的答案是对还是错。请提供理由。

2.6 Task 6: Initial Vector (IV) 任务6

Most of the encryption modes require an initial vector (IV). Properties of an IV depend on the cryptographic scheme used. If we are not careful in selecting IVs, the data encrypted by us may not be secure at all, even though we are using a secure encryption algorithm and mode. The objective of this task is to help students understand the problems if an IV is not selected properly. Please do the following experiments:

大多数加密模式需要一个初始向量 (IV)。IV 的属性取决于所使用的加密方案。如果我们在选择 IV 时不小心，即使我们使用的是安全的加密算法和模式，我们加密的数据也可能根本不安全。此任务的目的是帮助学生了解 IV 选择不当时出现的问题。请做以下实验：

2.6.1 Task 6.1. Uniqueness of the IV

A basic requirement for IV is *uniqueness*, which means that no IV may be reused under the same key. To understand why, please encrypt the same plaintext using (1) two different IVs, and (2) the same IV. Please describe your observation, based on which, explain why IV needs to be unique.

IV 的基本要求是唯一性，这意味着不能在同一密钥下重复使用任何 IV。要了解原因，请使用 (1) 两个不同的 IV 和 (2) 相同的 IV 加密相同的明文。请描述您的观察结果，并在此基础上解释为什么 IV 需要是唯一的。

2.6.2 Task 6.2. Common Mistake: Use the Same IV

One may argue that if the plaintext does not repeat, using the same IV is safe. Let us look at the Output Feedback (OFB) mode. Assume that the attacker gets hold of a plaintext (`P1`) and a ciphertext (`C1`), can he/she decrypt other encrypted messages if the IV is always the same? You are given the following information, please try to figure out the actual content of `P2` based on `C2`, `P1`, and `C1`.

有人可能会争辩说，如果明文不重复，使用相同的 IV 是安全的。让我们看看输出反馈 (OFB) 模式。假设攻击者获得了一个明文 (`P1`) 和一个密文 (`C1`)，如果 IV 总是相同的，他/她能否解密其他加密消息？为您提供以下信息，请根据 `C2`、`P1` 和 `C1` 尝试找出 `P2` 的实际内容。

Plaintext (`P1`): This is a known message!

Ciphertext (C1): a469b1c502c1cab966965e50425438e1bb1b5f9037a4c15913

Plaintext (P2): (unknown to you)

Ciphertext (C2): bf73bcd3509299d566c35b5d450337e1bb175f903fafc15913

If we replace OFB in this experiment with CFB (Cipher Feedback), how much of P2 can be revealed? You only need to answer the question; there is no need to demonstrate that.

The attack used in this experiment is called the **known-plaintext attack**, which is an attack model for cryptanalysis where the attacker has access to both the plaintext and its encrypted version (ciphertext). If this can lead to the revealing of further secret information, the encryption scheme is not considered as secure.

如果我们用CFB (Cipher Feedback) 代替本实验中的OFB, 可以透露多少P2? 你只需要回答问题; 没有必要证明这一点。

本实验中使用的攻击称为: 已知明文攻击, 这是一种用于密码分析的攻击模型, 攻击者可以访问明文及其加密版本 (密文)。如果这会导致泄露更多秘密信息, 则加密方案不被视为安全。

2.6.3 Task 6.3. Common Mistake: Use a Predictable IV

From the previous tasks, we now know that IVs cannot repeat. Another important requirement on IV is that IVs need to be unpredictable for many schemes, i.e., IVs need to be randomly generated. In this task, we will see what is going to happen if IVs are predictable.

Assume that Bob just sent out an encrypted message, and Eve knows that its content is either **Yes or No**; Eve can see the ciphertext and the IV used to encrypt the message, but since the encryption algorithm AES is quite strong, Eve has no idea what the actual content is. However, since Bob uses predictable IVs, Eve knows exactly what IV Bob is going to use next. The following summarizes what Bob and Eve know:

从之前的任务中, 我们现在知道 IV 不能重复。IV 的另一个重要要求是, 对于许多方案, IV 需要是不可预测的, 即 IV 需要随机生成。在这项任务中, 我们将看到如果 IV 是可预测的, 将会发生什么。

假设 Bob 刚刚发送了一条加密消息, 而 Eve 知道它的内容是 Yes 或 No; Eve 可以看到密文和用于加密消息的 IV, 但是由于加密算法 AES 非常强大, Eve 不知道实际内容是什么。然而, 由于 Bob 使用可预测的 IV, Eve 确切地知道 Bob 下一步将使用什么 IV。以下总结了 Bob 和 Eve 所知道的:

Encryption method: 128-bit AES with CBC mode.

Key (in hex): 00112233445566778899aabbccddeeff (known only to Bob)

Ciphertext (C1): bef65565572ccee2a9f9553154ed9498 (known to both)

IV used on P1 (known to both)

(in ascii): 1234567890123456

(in hex): 31323334353637383930313233343536

Next IV (known to both)

(in ascii): 1234567890123457

(in hex): 31323334353637383930313233343537

A good cipher should not only tolerate the **known-plaintext attack** described previously, it should also tolerate the **chosen-plaintext attack**, which is an attack model for cryptanalysis where the attacker can obtain the ciphertext for an arbitrary plaintext. Since AES is a strong cipher that can tolerate the chosen plaintext attack, Bob does not mind encrypting any plaintext given by Eve; he does use a different IV for each plaintext, but unfortunately, the IVs he generates are not random, and they can always be predictable.

一个好的密码不仅应该容忍前面描述的已知明文攻击, 还应该容忍选择明文攻击, 这是一种密码分析的攻击模型, 攻击者可以获得任意明文的密文。由于 AES 是一种可以容忍所选明文攻击的强密码, 因此 Bob 不介意加密 Eve 给出的任何明文; 他确实为每个明文使用了不同的 IV, 但不幸的是, 他生成的 IV 不是随机的, 而且它们总是可以预测的。

Your job is to construct a message P2 and ask Bob to encrypt it and give you the ciphertext. Your

objective is to use this opportunity to figure out whether the actual content of P1 is Yes or No .

你的工作是构造一条消息 P2 并要求 Bob 对其进行加密并给你密文。 您的目标是利用这个机会弄清楚 P1 的实际内容是 Yes 还是 No 。

2.7 Additional Readings

There are more advanced cryptanalysis on IV that is beyond the scope of this lab. Students can read the article posted in this URL: <https://defuse.ca/cbcmodeiv.htm>. Because the requirements on IV really depend on cryptographic schemes, it is hard to remember what properties should be maintained when we select an IV. However, we will be safe if we always use a new IV for each encryption, and the new IV needs to be generated using a good pseudo random number generator, so it is unpredictable by adversaries. Students can read this Wikipedia page for ideas: Initialization vector (https://en.wikipedia.org/wiki/Initialization_vector).

关于 IV 的更高级密码分析超出了本实验室的范围。 学生可以阅读在此 URL 中发布的文章：<https://defuse.ca/cbcmodeiv.htm>。 因为对 IV 的要求确实取决于密码方案，所以在选择 IV 时很难记住应该保持哪些属性。 但是，如果每次加密总是使用新的IV，我们就会安全，并且新的IV需要使用良好的伪随机数生成器生成，因此对手无法预测。学生可以阅读此维基百科页面以获取想法：初始化向量 (https://en.wikipedia.org/wiki/Initialization_vector)。

2.8 Task 7: Programming using the Crypto Library - Extra Credit 5% 任务7

So far, we have learned how to use the tools provided by openssl to encrypt and decrypt messages. In this task, we will learn how to use openssl's crypto library to encrypt/decrypt messages in programs.

In this task, you are given a plaintext and a ciphertext, and your job is to find the key that is used for the encryption. You do know the following facts:

- The aes-128-cbc cipher is used for the encryption.
- The key used to encrypt this plaintext is an English word shorter than 16 characters; the word can be found from a typical English dictionary. Since the word has less than 16 characters (i.e. 128 bits), pound signs (#: hexadecimal value is 0x23) are appended to the end of the word to form a key of 128 bits.

Your goal is to write a program to find out the encryption key. You can download an English word list from the Internet or from course Blackboard (words.txt). The plaintext, ciphertext, and IV are listed in the following:

至此，我们已经学会了如何使用openssl提供的工具对消息进行加密和解密。 在这个任务中，我们将学习如何使用 openssl 的加密库来加密/解密程序中的消息。

在此任务中，您将获得一个明文和一个密文，您的工作是找到用于加密的密钥。 你确实知道以下事实：

- aes-128-cbc 密码用于加密。
- 用于加密该明文的密钥是一个少于 16 个字符的英文单词； 这个词可以从典型的英语词典中找到。 由于单词少于 16 个字符（即 128 位），因此将井号（#: 十六进制值为 0x23 ）附加到单词的末尾以形成 128 位的密钥。

您的目标是编写一个程序来找出加密密钥。 你可以从网上下载英文单词表或表格课程黑板（words.txt）。 明文、密文和IV如下所示：

Plaintext (total 21 characters): This is a secret tool
Ciphertext (in hex format): 53616c7465645f5fe90f4f0d0cffc0069b2ab11a7d01079a
eec6df9c5bf4848fc086cbeb6b4ae6e8138f717dd7fc5a53

IV (in hex format): 010203040506070809000a0b0c0d0e0f

You need to pay attention to the following issues:

- If you choose to store the plaintext message in a file, and feed the file to your program, you need to check whether the file length is 21. If you type the message in a text editor, you need to be aware that some editors may add a special character to the end of the file. The easiest way to store the message in a file is to use the following command (the `-n` flag tells `echo` not to add a trailing newline):

您需要注意以下问题：

- 如果您选择将纯文本消息存储在文件中，并将该文件提供给您的程序，您需要检查文件长度是否为 21。如果您在文本编辑器中键入消息，您需要注意一些编辑器可以在文件末尾添加一个特殊字符。将消息存储在文件中的最简单方法是使用以下命令（`-n` 标志告诉 `echo` 不要添加尾随换行符）：

```
$ echo -n "This is a secret tool" > file
```

- In this task, you are supposed to write your own program to invoke the `crypto` library. No credit will be given if you simply use the `openssl` commands to do this task. Sample code can be found from the following URL: [OpenSSL: EVP Encrypt Int](#)
- When you compile your code using `gcc`, do not forget to include the `-lcrypto` flag, because your code needs the `crypto` library. See the following example:
- 在此任务中，您应该编写自己的程序来调用加密库。如果您只是使用 `openssl` 命令来执行此任务，则不会给予任何信用。示例代码可以从以下 URL 找到：[OpenSSL: EVP Encrypt Int](#)
- 当您使用 `gcc` 编译代码时，不要忘记包含 `-lcrypto` 标志，因为您的代码需要加密库。请参阅以下示例：

```
$ gcc -o myenc myenc.c -lcrypto
```

3 DES/AES explained as a Flash animation

- DES: <https://www.youtube.com/watch?v=Vcld7CMAAnNs>
- AES: <https://www.youtube.com/watch?v=gP4PqVGudtg>

4 Submission

You need to submit a detailed lab report, with screenshots, to describe what you have done and what you have observed. You also need to provide explanation to the observations that are interesting or surprising. Please also list the important code snippets followed by explanation. Simply attaching code without any explanation will not receive credits.

Your report must be a `.pdf` file that is uploaded to Blackboard for `Lab 2`.

4 提交

您需要提交一份详细的实验室报告，并附有屏幕截图，以描述您所做的和所观察到的。您还需要对有趣或令人惊讶的观察结果进行解释。还请列出重要的代码片段，然后进行解释。简单地附上代码而没有任何解释将不会获得积分。

您的报告必须是上传到 Blackboard for Lab 2 的 `.pdf` 文件
