

COMP9120

Week 5: Advanced SQL

Semester 1, 2022

Dr Mohammad Polash
School of Computer Science

THE UNIVERSITY OF
SYDNEY

› **Quiz** next week (week 6)

- Released on Thursday, 31 March at 23:59
- Due date Friday, 1 April at 23:59
- Quiz duration → 1.5 hours
 - Only one attempt is allowed
- 10 MCQ questions (on week1 – week 5 contents)
- 3 essay questions
 - ERD to logical design
 - Relational Algebra
 - SQL
- Practice quiz is available in Canvas to familiarize yourself with the system

Acknowledgement of Country

I would like to acknowledge the Traditional Owners of Australia and recognise their continuing connection to land, water and culture. I am currently on the land of the Gadigal People of the Eora nation and pay my respects to their Elders, past, present and emerging.

I further acknowledge the Traditional Owners of the country on which you are on and pay respects to their Elders, past, present and future.

1001	Adam	M	AUS
1002	Bob	M	ROK
1003	Lily	F	AUS
1004	Simon	M	GBR
1005	Jesse	F	CHN
1006	Adam	M	GER

Enrolled			
<u>sid</u>	<u>uos_code</u>	semester	marks
1001	COMP5138	2020-S2	72
1002	COMP5702	2020-S2	85
1003	COMP5138	2020-S2	67
1006	COMP5318	2020-S2	94
1003	ISYS3207	2020-S1	78
1006	ISYS3207	2020-S2	40

UnitOfStudy		
<u>uos_code</u>	title	points
COMP5138	Relational DBMS	6
COMP5318	Data Mining	6
INFO6007	IT Project Management	6
SOFT1002	Algorithms	12
ISYS3207	IS Project	4
COMP5702	MIT Research Project	18

- Find id of all students who are enrolled in both 'COMP5138' and 'ISYS3207'.

```
SELECT sid FROM Enrolled WHERE uos_code='COMP5138'
INTERSECT
SELECT sid FROM Enrolled WHERE uos_code='ISYS3207'
```

- How about listing the **names** of students who are enrolled in both 'COMP5138' and 'ISYS3207'?

```
SELECT name FROM Student NATURAL JOIN Enrolled WHERE uos_code='COMP5138'
INTERSECT
SELECT name FROM Student NATURAL JOIN Enrolled WHERE uos_code='ISYS3207'
```

Is this correct?

NO!

Student			
<u>sid</u>	name	gender	country
1001	Adam	M	AUS
1002	Bob	M	ROK
1003	Lily	F	AUS
1004	Simon	M	GBR
1005	Jesse	F	CHN
1006	Adam	M	GER

Enrolled			
<u>sid</u>	<u>uos_code</u>	Semester	marks
1001	COMP5138	2020-S2	72
1002	COMP5702	2020-S2	85
1003	COMP5138	2020-S2	67
1006	COMP5318	2020-S2	94
1003	ISYS3207	2020-S1	78
1006	ISYS3207	2020-S2	40

- › **Nested Queries**
- › Aggregation and Grouping
- › NULL Values and Three-valued Logic

- › How about listing the names of students who enrolled in both 'COMP5138' and 'ISYS3207'?

```
SELECT name FROM Student NATURAL JOIN Enrolled WHERE uos_code='COMP5138'  
INTERSECT  
SELECT name FROM Student NATURAL JOIN Enrolled WHERE uos_code='ISYS3207'
```

- Correct SQL using nested queries

```
SELECT name  
FROM Student  
WHERE sid IN (  
    SELECT sid FROM Enrolled WHERE uos_code='COMP5138'  
    INTERSECT  
    SELECT sid FROM Enrolled WHERE uos_code='ISYS3207'  
)
```

This subquery lists the id of all students who are enrolled in both 'COMP5138' and 'ISYS3207'

- › SQL provides a mechanism for the nesting of queries to formulate complex queries
 - SQL is **compositional**: everything (inputs/outputs) is represented as multisets, the output of one query can thus be used as the input to another (nesting!)

- › A Select-From-Where expression that is nested within another query is called a **subquery**
 - Typically appear in the **WHERE** clause
 - But also, can appear in the **FROM** clause, **SELECT** clause, or **HAVING** clause

- › A common use of subqueries is to perform tests for *set membership*, *set comparisons*, and *set cardinality*.

Example: Nested Queries

- › Find the names of students who are enrolled in 'COMP5138'?

SELECT name

FROM Student

WHERE sid **IN** (**SELECT** sid
FROM Enrolled
WHERE uos_code='COMP5138')

The **IN** operator will test to see if the sid value of a row is included in the list returned from the subquery

Subquery is embedded in parentheses. In this case it returns a list that will be used in the **WHERE** clause of the outer query

v set-comparison R: v is a value in the outer query, R is the result of a subquery

› v **[NOT] IN** R

- tests whether v is in (or not in, if **NOT** is specified) R: **true** $\Leftrightarrow v \in R$

› **[NOT] EXISTS** R

- tests whether a set R is not (is, if **NOT** is specified) empty: **true** $\Leftrightarrow R \neq \emptyset$ (**true** $\Leftrightarrow R = \emptyset$)

› v op **ALL** R

- op can be $<$, \leq , $>$, \geq , $=$, \neq
- tests whether a predicate is true for the whole set: **true** $\Leftrightarrow \forall t \in R : (v \text{ op } t)$

› v op **SOME** R

- the same as v op **ANY** R
- tests whether a predicate is true for at least one set element: **true** $\Leftrightarrow \exists t \in R : (v \text{ op } t)$

- › Find the id of the student with the highest mark

```
SELECT sid  
FROM Enrolled  
WHERE marks >= ALL ( SELECT marks  
                        FROM Enrolled )
```

- › Find name of the students who did not enroll in 2020-S2 semester.

```
SELECT name  
FROM Student  
WHERE sid NOT IN( SELECT sid  
                  FROM Enrolled  
                  WHERE semester = '2020-S2')
```

› A view is a virtual table

- Defined through an SQL query, used as a table in other queries
- Normally evaluated on each use
 - Not evaluated once and stored
- Convenient way of encapsulating queries as tables

CREATE VIEW student_enrollment **AS**

SELECT sid, name, title, semester

FROM student **NATURAL JOIN** Enrolled **NATURAL JOIN** unitofstudy

SELECT *

FROM student_enrollment

ORDER BY name;

- › Find male students name who are enrolled in units that has the lowest credit point

Solution: [Without view and step-by-step nested query]

SELECT name

FROM Student

WHERE gender = 'M' **AND** sid **IN** (**SELECT** sid

FROM Enrolled

WHERE uos_code **IN** (**SELECT** uos_code

FROM UnitOfStudy

WHERE points <= **ALL** (**SELECT** points

FROM UnitOfStudy))));

- › Find male students name who are enrolled in units that has the lowest credit point

Solution: [Using View]

CREATE VIEW MaleStudents **AS**

SELECT sid, name

FROM Student

WHERE gender = 'M';

CREATE VIEW LowestCreditPointUnit **AS**

SELECT uos_code

FROM UnitOfStudy

WHERE points <= **ALL** (**SELECT** points

FROM UnitOfStudy);

SELECT name

FROM MaleStudents

WHERE sid **IN** (**SELECT** sid

FROM Enrolled

WHERE uos_code **IN** (**SELECT** uos_code

FROM LowestCreditPointUnit));

- › Nested Queries
- › **Aggregation and Grouping**
- › NULL Values and Three-valued Logic

- › Besides retrieving data, SQL supports several **aggregation** operations
 - **COUNT**, **SUM**, **AVG**, **MAX**, **MIN** (also called aggregate functions)
 - Except **COUNT**, all aggregations apply to a single attribute
 - These operations apply to duplicates, unless **DISTINCT** is specified

- › How many courses are there?
 - **SELECT COUNT(*) FROM** unitofstudy
- › Find the highest mark for 'COMP5138'?
 - **SELECT MAX(marks) FROM** Enrolled
WHERE uos_code = 'COMP5138'
- › Find the average mark of 'COMP5138'?
 - **SELECT AVG(marks) FROM** Enrolled
WHERE uos_code = 'COMP5138'
- › How many students are enrolled?
 - **SELECT COUNT(DISTINCT sid) FROM** Enrolled

<i>Enrolled</i>			
<u>sid</u> -----	<u>uos_code</u> -----	Semester	marks
1001	COMP5138	2020-S2	72

<u>uos_code</u>	title	points
COMP5138	Relational DBMS	6
COMP5318	Data Mining	6
INFO6007	IT Project Management	6
SOFT1002	Algorithms	12
ISYS3207	IS Project	4
COMP5702	MIT Research Project	18

- › Instead of aggregating all (qualifying) tuples into a single value, sometimes we want to apply aggregation to each of several *groups* of tuples.
- › Example: Find the total sales amount of each company

Sales Table

id	company	amount
1	IBM	5500
2	DELL	4500
3	IBM	6500

~~SELECT company, SUM(amount)
FROM Sales~~

company	amount
IBM	16500
DELL	16500
IBM	16500

SELECT company, SUM(amount)
FROM Sales
GROUP BY company

company	amount
IBM	12000
DELL	4500

- › In SQL, we can “partition” a relation into *groups* according to the value(s) of one or more attributes:

SELECT target-list
FROM relation-list
WHERE qualification
GROUP BY grouping-list
HAVING group-qualification

SELECT company, **SUM**(amount)
FROM Sales
GROUP BY company

- › A *group* is a set of tuples that have the same value for all attributes in grouping-list.
- › NOTE: Attributes in the **SELECT** / **HAVING** clause must be either in aggregate functions or from the grouping-list
 - Intuitively, each result tuple corresponds to a *group*, and these attributes must have a single value per group.

Group By Overview

```
SELECT company, SUM(amount)
FROM Sales
GROUP BY company
```

Sales Table

id	company	amount
1	IBM	5500
2	DELL	4500
3	IBM	6500

company	amount
IBM	5500
IBM	6500
DELL	4500

company	amount
IBM	12000
DELL	4500

- › Find the total number of student from each country

```
SELECT country, COUNT(*)  
FROM student  
GROUP BY country;
```

- › Find the total number of Male and Female student

```
SELECT gender, COUNT(*)  
FROM student  
GROUP BY gender;
```

<i>Student</i>			
<u>sid</u>	name	gender	country
1001	Adam	M	AUS
1002	Bob	M	ROK
1003	Lily	F	AUS
1004	Simon	M	GBR
1005	Jesse	F	CHN
1006	Adam	M	GER

› Group By Example:

- List courses and their average marks

```
SELECT uos_code, AVG(marks)
FROM enrolled
GROUP BY uos_code
```

› **HAVING** clause can further filter groups to fulfil a predicate

- Example: Find courses that have average mark > 60, and their average marks

```
SELECT uos_code, AVG(mark)
FROM enrolled
GROUP BY uos_code
HAVING AVG(mark) > 60
```

- NOTE: Predicates in the **HAVING** clause are applied after the formation of groups, whereas predicates in the **WHERE** clause are applied before forming groups

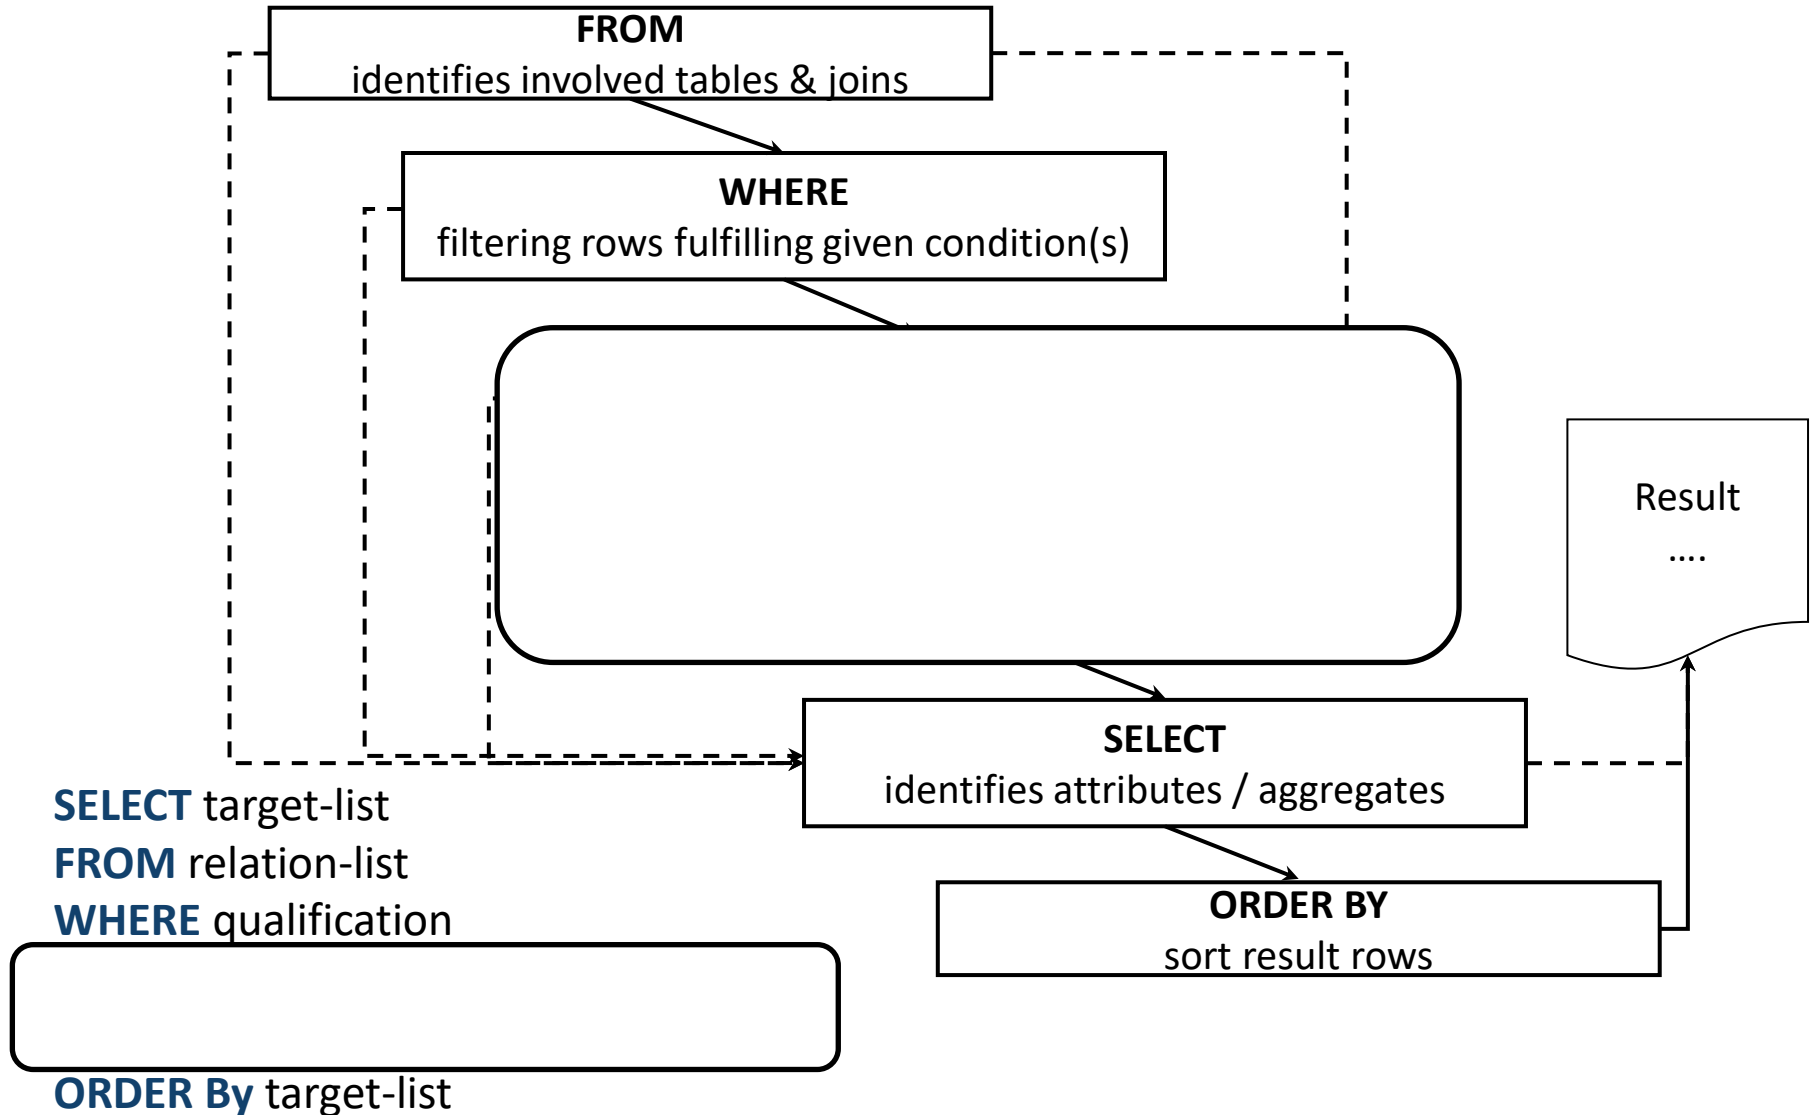

- › Select the country name with more than 1 student

```
SELECT country  
FROM student  
GROUP BY country  
HAVING COUNT(*) > 1;
```

<i>Student</i>			
<u>sid</u>	name	gender	country
1001	Adam	M	AUS
1002	Bob	M	ROK
1003	Lily	F	AUS
1004	Simon	M	GBR
1005	Jesse	F	CHN
1006	Adam	M	GER

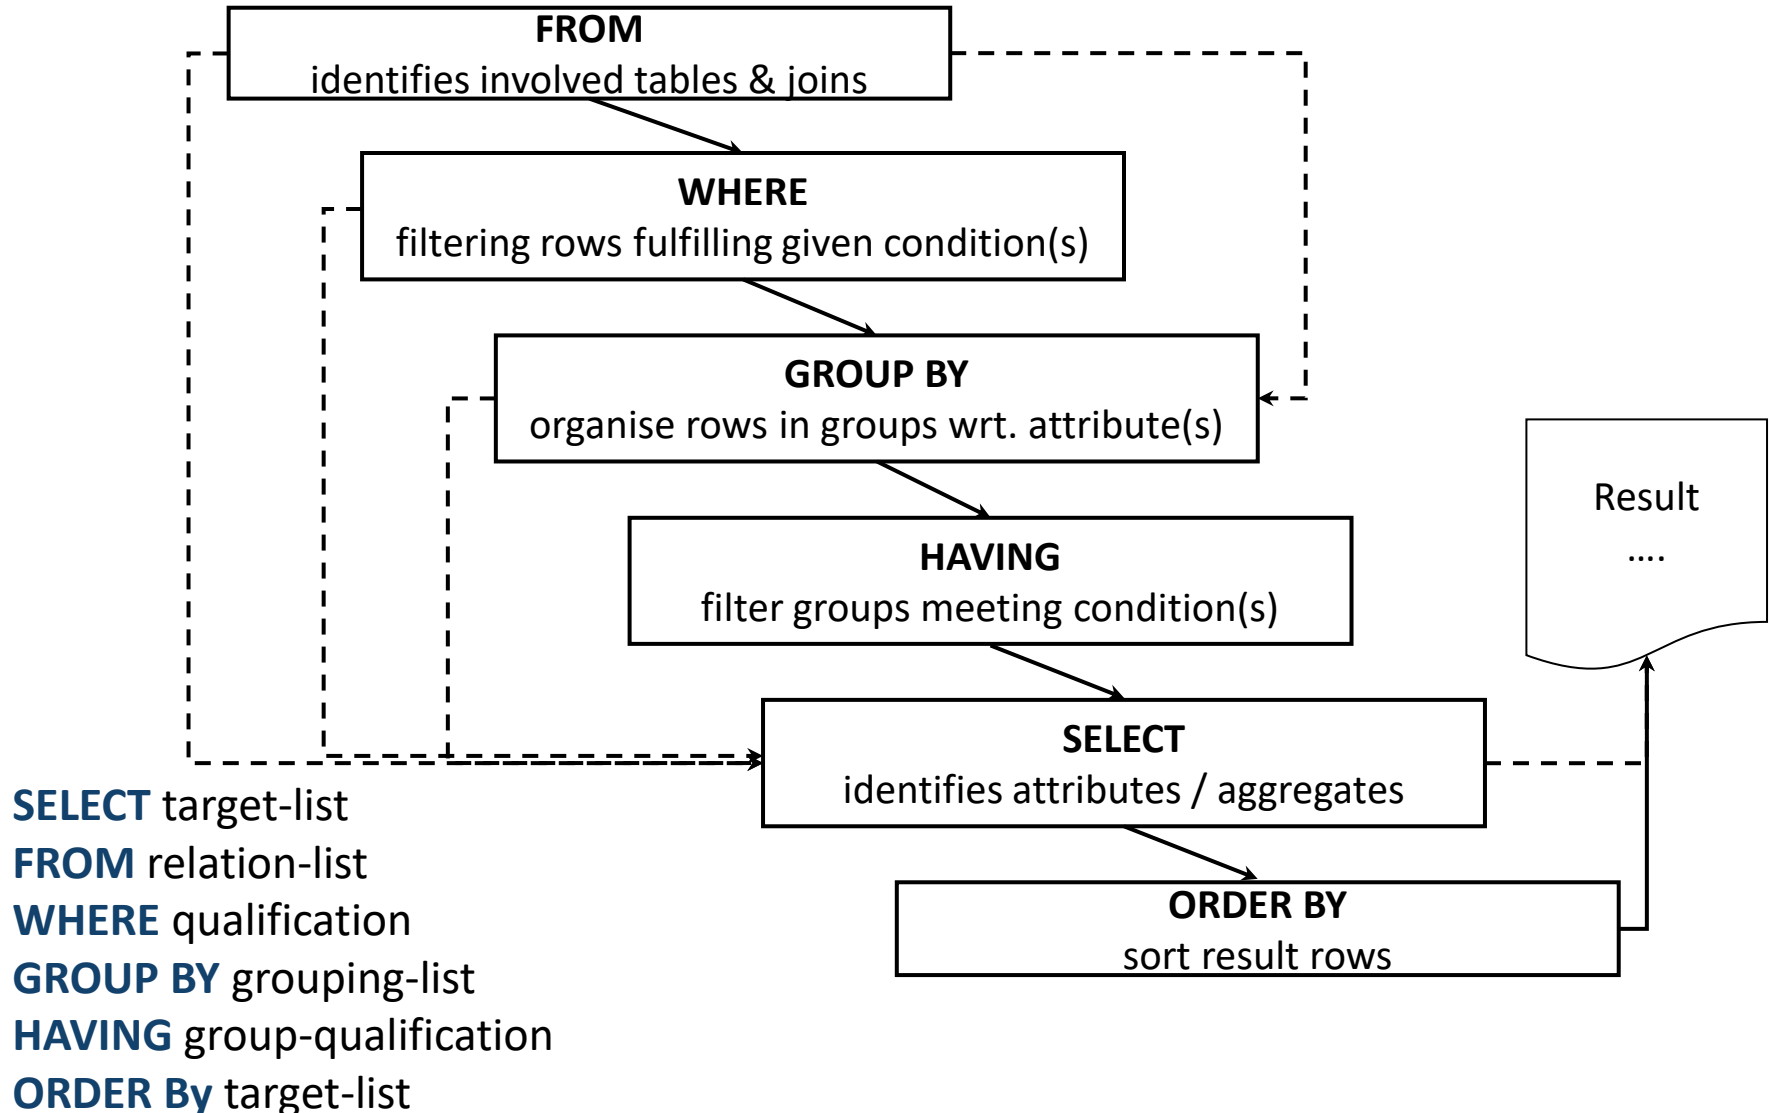

Query-Clause Evaluation Order

Query-Clause Evaluation Order

- › Find the maximum marks of 6-credit point courses with at least 2 students

```
SELECT uos_code, MAX(marks)
FROM enrolled NATURAL JOIN UnitOfStudy
WHERE points = 6
GROUP BY uos_code
HAVING COUNT(*) >= 2
```

1. enrolled and UnitOfStudy are joined

FROM enrolled **NATURAL JOIN** UnitOfStudy

2. Tuples that fail the **WHERE** condition are discarded

WHERE credit_points = 6

	uos_code character (8)	sid integer	semester character varying	marks integer	title character varying (30)	points integer
1	COMP5138	1001	2020-S2	72	Relational DBMS	6
2	COMP5702	1002	2020-S2	85	MIT Research Project	18
3	COMP5138	1003	2020-S2	67	Relational DBMS	6
4	COMP5318	1006	2020-S2	94	Data Mining	6
5	ISYS3207	1003	2020-S2	78	IS Project	4
6	ISYS3207	1006	2020-S1	40	IS Project	4

Evaluation Example (cont' d)

3. Remaining tuples are partitioned into groups by the value of attributes in the grouping-list (uos_code).

GROUP BY uos_code

4. Groups which fail the **HAVING** condition are discarded.

HAVING COUNT(*) >= 2

uos_code character (8)	sid integer	semester character varying	marks integer	title character varying (30)	points integer
COMP5138	1001	2020-S2	72	Relational DBMS	6
COMP5138	1003	2020-S2	67	Relational DBMS	6
COMP5318	1006	2020-S2	94	Data Mining	6

5. ONE result tuple is generated per group

SELECT uos_code, **MAX**(mark)

uos_code	MAX(mark)
COMP5138	72

- › Find the uos code in which students have got the lowest average mark

Solution:

```
SELECT uos_code
FROM enrolled
GROUP BY uos_code
HAVING AVG(marks) <= ALL (SELECT AVG (marks)
                             FROM enrolled
                             GROUP BY uos_code);
```

NOTE: aggregate function calls cannot be nested

- › Nested Queries
- › Aggregation and Grouping
- › **NULL Values and Three-valued Logic**

- › It is possible for tuples to have a null value, denoted by **NULL**, for some of their attributes
 - **NULL** signifies that a value *does not exist* or *not applicable*, it does *not mean* “0” or “blank”!
 - Integral part of SQL to handle missing / unknown information
- › The predicate **IS NULL** or **IS NOT NULL** can be used to check for null values
 - e.g. Find students who don't have a mark for an assessment yet.

```
SELECT sid
FROM enrolled
WHERE marks IS NULL
```

- › The result of any arithmetic expression involving NULL is NULL
 - e.g. $5 + \text{NULL}$ returns NULL

- › Any comparison with NULL returns **unknown**
 - e.g. $5 < \text{NULL}$ or $\text{NULL} <> \text{NULL}$ or $\text{NULL} = \text{NULL}$

- › Result of **WHERE** clause predicate is treated as **false** if it evaluates to **unknown**
 - e.g: **SELECT** sid **FROM** enrolled **WHERE** marks < 50
ignores all students without a mark so far

- › Three-valued logic for Boolean operations
 - OR: (**unknown OR true**) = **true**, (**unknown OR false**) = **unknown**
(**unknown OR unknown**) = **unknown**
 - AND: (**true AND unknown**) = **unknown**, (**false AND unknown**) = **false**,
(**unknown AND unknown**) = **unknown**
 - NOT: (**NOT unknown**) = **unknown**

- › It is equivalent to the following

true = 1
unknown = 0.5
false = 0

$B1 \text{ AND } B2 = \min(B1, B2)$
 $B1 \text{ OR } B2 = \max(B1, B2)$
 $\text{NOT } B1 = 1 - B1$

Unexpected Behavior of NULL Values

```
SELECT *  
FROM enrolled  
WHERE marks < 25 OR marks >= 25
```

The students whose marks are unknown will not be returned!

```
SELECT *  
FROM enrolled  
WHERE marks < 25 OR marks >= 25 OR marks IS NULL
```

This SQL now lists all students!

- › Aggregate functions ignore NULL values on the aggregated attributes
- › Result of an aggregate function is NULL if there is no non-null rows

- › Examples:

- Minimum mark of all courses

```
SELECT MIN(marks)    -- ignores tuples with nulls on mark  
FROM enrolled
```

- Number of all courses

```
SELECT COUNT(*)    -- counts all tuples  
FROM enrolled
```

- Number of all courses with a mark

```
SELECT COUNT(marks)    -- ignores tuples with nulls on mark  
FROM enrolled
```

- › **...formulate even complex SQL Queries**
 - Including multiple joins with correct join conditions
 - Aggregate functions
 - Grouping and Having conditions
 - Handling NULL values
