2.1

$AB \rightarrow C$ ,  $C \rightarrow DE$ ,  $DE \rightarrow B$ ,  $BC \rightarrow A$

Compute the closures for all possible combinations of the attributes in R:

marks 5

$(A)^+ = A$ ,  $(B)^+ = B$ ,  $(C)^+ = C$ ,  $(D)^+ = D$ ,  $(E)^+ = E$ ;

Notice that C is a single attribute, so firstly build the closure of C:

$(C)^+ \supseteq C$  (initialisation)  
 $\supseteq CDE$  (Using  $C \rightarrow DE$ )  
 $\supseteq CDEB$  (Using  $DE \rightarrow B$ )  
 $\supseteq CDEBA$  (Using  $BC \rightarrow A$ )  
 $= CDEBA$

If no proper subset  $Y$  of  $X$  with  $Y^+ = R$ , therefore,  $C$  is the candidate key.

Compute the closures for all possible combinations of the attributes in  $R$  that contain two attributes:  $AB, AD, AE, BD, BE, DE$

$(AB)^+ \supseteq AB$  (initialisation)  
 $\supseteq ABC$  (Using  $AB \rightarrow C$ )  
 $\supseteq ABCDE$  (Using  $C \rightarrow DE$ )  
 $= ABCDE$

$(AD)^+ = AD$

$(AE)^+ = AE$

$(BD)^+ = BD$

$(BE)^+ = BE$

$(DE)^+ = DEB$  (Using  $DE \rightarrow B$ )

Therefore,  $AB$  is also a candidate key.

Compute the closures for all possible combinations of the attributes in  $R$  that contain three attributes:  $ADE, BDE$

$(ADE)^+ \supseteq ADE$  (initialisation)  
 $\supseteq ADEB$  (Using  $DE \rightarrow B$ )  
 $\supseteq ADEBC$  (Using  $AB \rightarrow C$ )  
 $= ADEBC$

$(BDE)^+ = BDE$

Therefore, ADE is a candidate key too.

## 2.2

In order to find the minimal cover, firstly ensure that all functional dependencies only determine one attribute:  $C \rightarrow \underline{DE}$ ,  $\underline{AB} \rightarrow C$ ,  $\underline{DE} \rightarrow B$ ,  $\underline{BC} \rightarrow A$

Check for redundant attributes by repeating the above steps in 2.1:

$C \rightarrow DE$ ?  $D \in (C)^+$  under  $\Sigma$ ?:  $(C)^+ = (ABCDE)$  ✓  $C \rightarrow D$

$C \rightarrow DE$ ?  $E \in (C)^+$  under  $\Sigma$ ?:  $(C)^+ = (ABCDE)$  ✓  $C \rightarrow E$

$AB \rightarrow C$ ?  $C \in (A)^+$  under  $\Sigma$ ?:  $(A)^+ = (A)$  ✗  $AB \rightarrow C$

$AB \rightarrow C$ ?  $C \in (B)^+$  under  $\Sigma$ ?:  $(B)^+ = (B)$  ✗  $AB \rightarrow C$

$DE \rightarrow B$ ?  $B \in (D)^+$  under  $\Sigma$ ?:  $(D)^+ = (D)$  ✗  $DE \rightarrow B$

$DE \rightarrow B$ ?  $B \in (E)^+$  under  $\Sigma$ ?:  $(E)^+ = (E)$  ✗  $DE \rightarrow B$

$BC \rightarrow A$ ?  $A \in (B)^+$  under  $\Sigma$ ?:  $(B)^+ = (B)$  ✗  $BC \rightarrow A$

$BC \rightarrow A$ ?  $A \in (C)^+$  under  $\Sigma$ ?:  $(C)^+ = (ABCDE)$  ✓  $C \rightarrow A$

Minimal cover:  $\Sigma = (AB \rightarrow C, C \rightarrow D, C \rightarrow E, DE \rightarrow B, C \rightarrow A)$

## 2.3

$\Sigma = (AB \rightarrow C, C \rightarrow DE, DE \rightarrow B, BC \rightarrow A)$

$\Sigma_1 = (AB \rightarrow CDE, DE \rightarrow B, C \rightarrow AB)$

So firstly build the closures of  $\Sigma_1$ :

$(C)^+ \supseteq C$  (initialisation)  
 $\supseteq CAB$  (Using  $C \rightarrow AB$ )  
 $\supseteq CABDE$  (Using  $AB \rightarrow CDE$ )  
 $= CABDE$

$(AB)^+ \supseteq AB$  (initialisation)  
 $\supseteq ABCDE$  (Using  $AB \rightarrow CDE$ )  
 $= ABCDE$

$(DE)^+ \supseteq DE$  (initialisation)  
 $\supseteq DEB$  (Using  $DE \rightarrow B$ )  
 $= DEB$

$\Sigma: AB \rightarrow C$  (ABCDE) =  $\Sigma_1: AB \rightarrow CDE$  (ABCDE)

$\Sigma: C \rightarrow DE$  (CABDE) =  $\Sigma_1: C \rightarrow AB$  (CABDE)

$\Sigma: DE \rightarrow B$  (DEB) =  $\Sigma_1: DE \rightarrow B$  (DEB)

$\Sigma: BC \rightarrow A$  (ABCDE) =  $\Sigma_1: C \rightarrow AB$  (ABCDE)

They are equivalent because  $\Sigma \models \Sigma_1$  and  $\Sigma_1 \models \Sigma$ .

3.

Q3: 1.75/2 marks

Alias the attributes to their first letter of their names for clarity.

$A = (P, G, D, T, C, R)$

$PCD \rightarrow T$

$P \rightarrow G$

$G \rightarrow C$

$CDTR \rightarrow P$

$PDT \rightarrow CR$

Firstly check the closure of the left-hand side (determinant):

$(PCD)^+ \supseteq PCD$  (initialisation)  
 $\supseteq PCDT$  (Using  $PCD \rightarrow T$ )  
 $\supseteq PCDTTR$  (Using  $CDTR \rightarrow P$ )  
 $\supseteq PCDTTRG$  (Using  $P \rightarrow G$ )  
 $= PCDTTRG \quad \checkmark$

$(P)^+$   $\supseteq$  P (initialisation)  
 $\supseteq$  PG (Using  $P \rightarrow G$ )  
 $\supseteq$  PGC (Using  $G \rightarrow C$ )  
 $=$  PGC     ✗

$(G)^+$   $\supseteq$  G (initialisation)  
 $\supseteq$  GC (Using  $G \rightarrow C$ )  
 $=$  GC     ✗

$(CDTR)^+$   $\supseteq$  CDTR (initialisation)  
 $\supseteq$  CDTRP (Using  $CDTR \rightarrow P$ )  
 $\supseteq$  CDTRPG (Using  $P \rightarrow G$ )  
 $=$  CDTRPG     ✓

$(PDT)^+$   $\supseteq$  PDT (initialisation)  
 $\supseteq$  PDTCR (Using  $PDT \rightarrow CR$ )  
 $\supseteq$  PDTCRG (Using  $P \rightarrow G$ )  
 $=$  PDTCRG     ✓

As indicated above, only three closures included all the attributes, therefore, Appointment is not in BCNF.

Then select FDs that violate BCNF requirements and decompose them. Firstly select  $P \rightarrow G$  and produce the below relations and FDs.

$R_A = (P, G)$

$\Sigma_A = (P \rightarrow G)$

$R_B = (P, D, T, C, R)$

$\Sigma_B = (PCD \rightarrow T, CDTR \rightarrow P, PDT \rightarrow CR)$

$\Sigma_B = (PCD \rightarrow T, CDTR \rightarrow P, PDT \rightarrow CR)$  is now in BCNF since both of them are superkeys for  $\Sigma_B$ . But is  $R_A$  not in BCNF because  $G \rightarrow C$  and  $G$  is not a superkey. Hence select  $G \rightarrow C$  and create the below decomposition of  $R_A$ .

$R_{A_1} = (G, C)$

$\Sigma_{A_1} = (G \rightarrow C)$

$R_{A_2} = (P, G)$

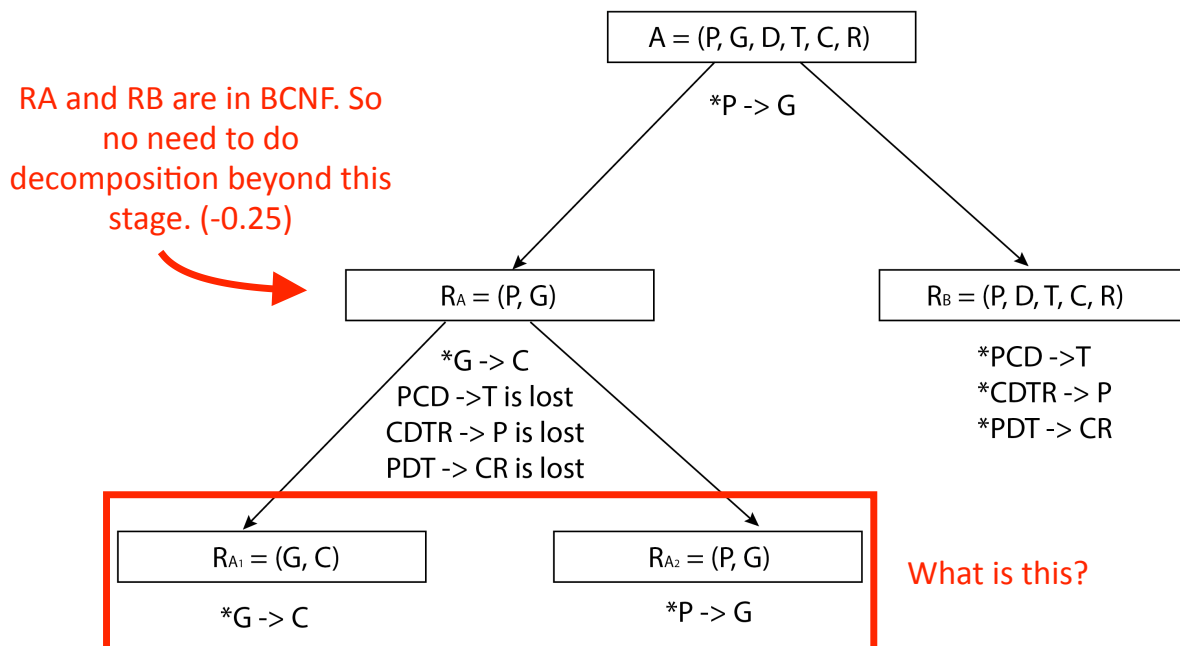

$\Sigma_{A_2} = (P \rightarrow G)$

$R_B = (P, D, T, C, R)$

$\Sigma_B = (PCD \rightarrow T, CDTR \rightarrow P, PDT \rightarrow CR)$

Note that  $PCD \rightarrow T, CDTR \rightarrow P, PDT \rightarrow CR$  are lost.

Wrong

Now  $R_{A_1}$ ,  $R_{A_2}$  and  $R_B$  are all in BCNF, they are then the decomposition of Appointment. Since the lost FDs cannot be recovered, the decomposition is not dependency-preserving.

Wrong justification for why the BCNF decomposition is not dependency-preserving. (-0.25)  
GP  $\rightarrow$  Clinic is lost.

Q4: 3.75/4 marks

4.1

(a)

$$R_1 = \pi_{TID} (\sigma_{\text{Semester} = 'S22021' \wedge \text{CourseNo} = 'COMP2400'} (\text{TUTOR}))$$

$$R_2 = \pi_{SID} (\sigma_{\text{Semester} = 'S22020' \wedge \text{CourseNo} = 'COMP2400'} (\text{ENROL}))$$

$$R_3 = \pi_{SID} (\sigma_{TID = SID} (R_1 \bowtie R_2))$$

$$R = \pi_{\text{phone}} (\text{STUDENT} \bowtie R_3)$$

1 mark

OR

$$R = \pi_{\text{phone}} (\pi_{SID} (\pi_{SID} (\sigma_{\text{Semester} = 'S22020' \wedge \text{CourseNo} = 'COMP2400'} (\text{ENROL})) = \pi_{TID} (\sigma_{\text{Semester} = 'S22021' \wedge \text{CourseNo} = 'COMP2400'} (\text{TUTOR})) \bowtie \text{STUDENT}))$$

(b)

$$R_1 = (\sigma_{\text{Semester} = 'S22021'} (\text{TUTOR}))$$

$$\text{Tutor}' = \sigma_{\text{Semester} = 'S22021'} (\text{TUTOR})$$

$$R_2 = \pi_{\text{TID}} (\sigma_{\varphi} (p_{R_A} (\text{Tutor}') \times p_{R_B} (\text{Tutor}'))$$

where RA.TID or RB.TID?

$$\varphi = ((R_A.\text{CourseNo} \neq R_B.\text{CourseNo}) \wedge (R_A.\text{TID} = R_B.\text{TID}))$$

$$R = \underline{R_1} - R_2$$

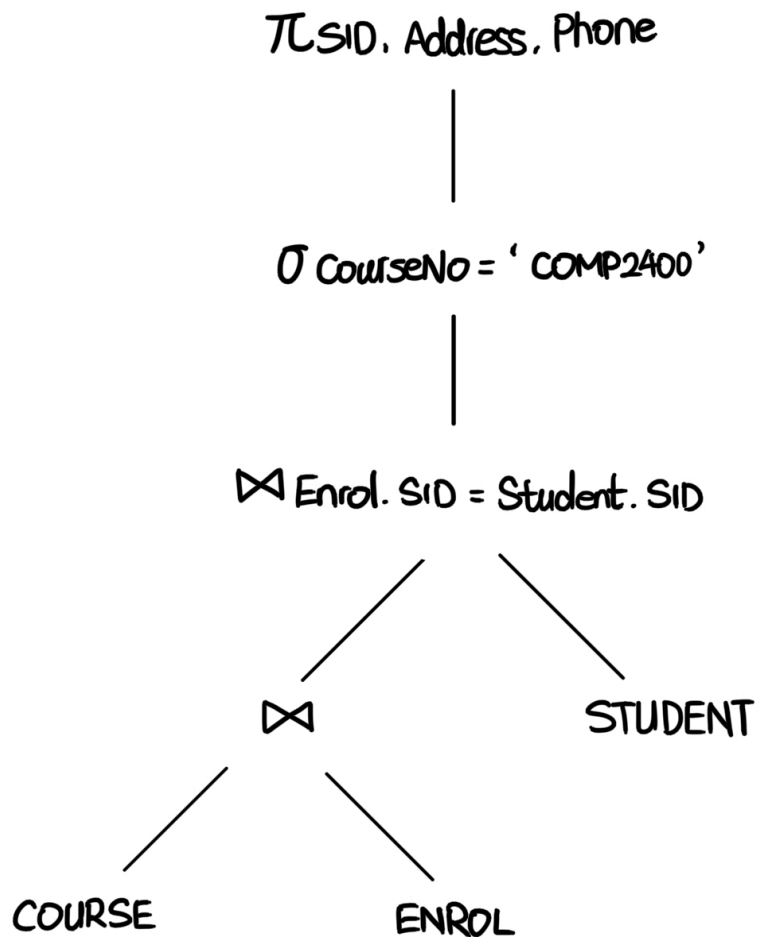

Missing projection of TID from R1 before set difference

## 4.2

Original Query Tree:

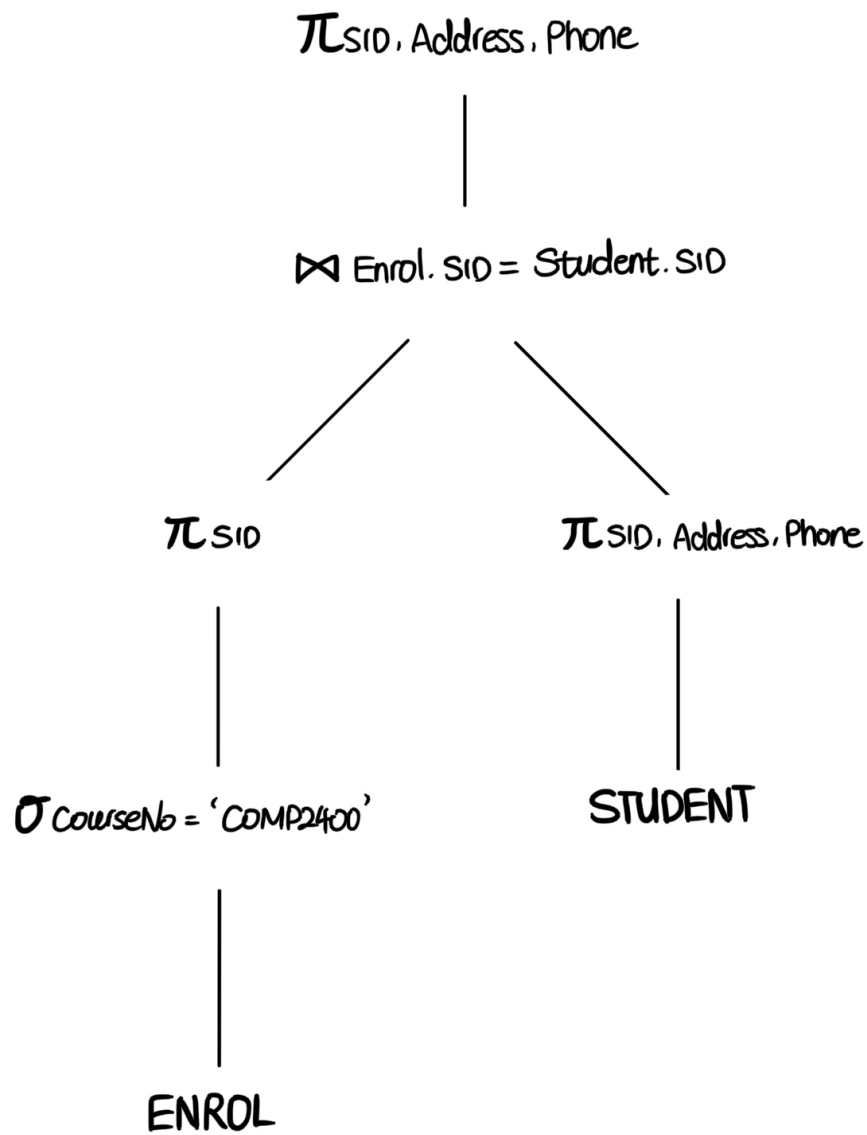

The intention is to list SID, addresses and phone numbers of students who enrolled in COMP2400, therefore the optimised solution is:

$\pi_{SID, Address, Phone}((\pi_{SID}(\sigma_{CourseNo = 'COMP2400'}(ENROL))) \bowtie_{ENROL.SID = STUDENT.SID}(\pi_{SID, Address, Phone}(STUDENT)))$

Optimised Query Tree:
