

Introduction to Databases 第七课

Structured Query Language (SQL) - Part 1

Joshua 2021.11.09

SQL语句 Structured Query Language (SQL)- Part 1

Lecture

Tutorial

Practice

Q&A

Lecture

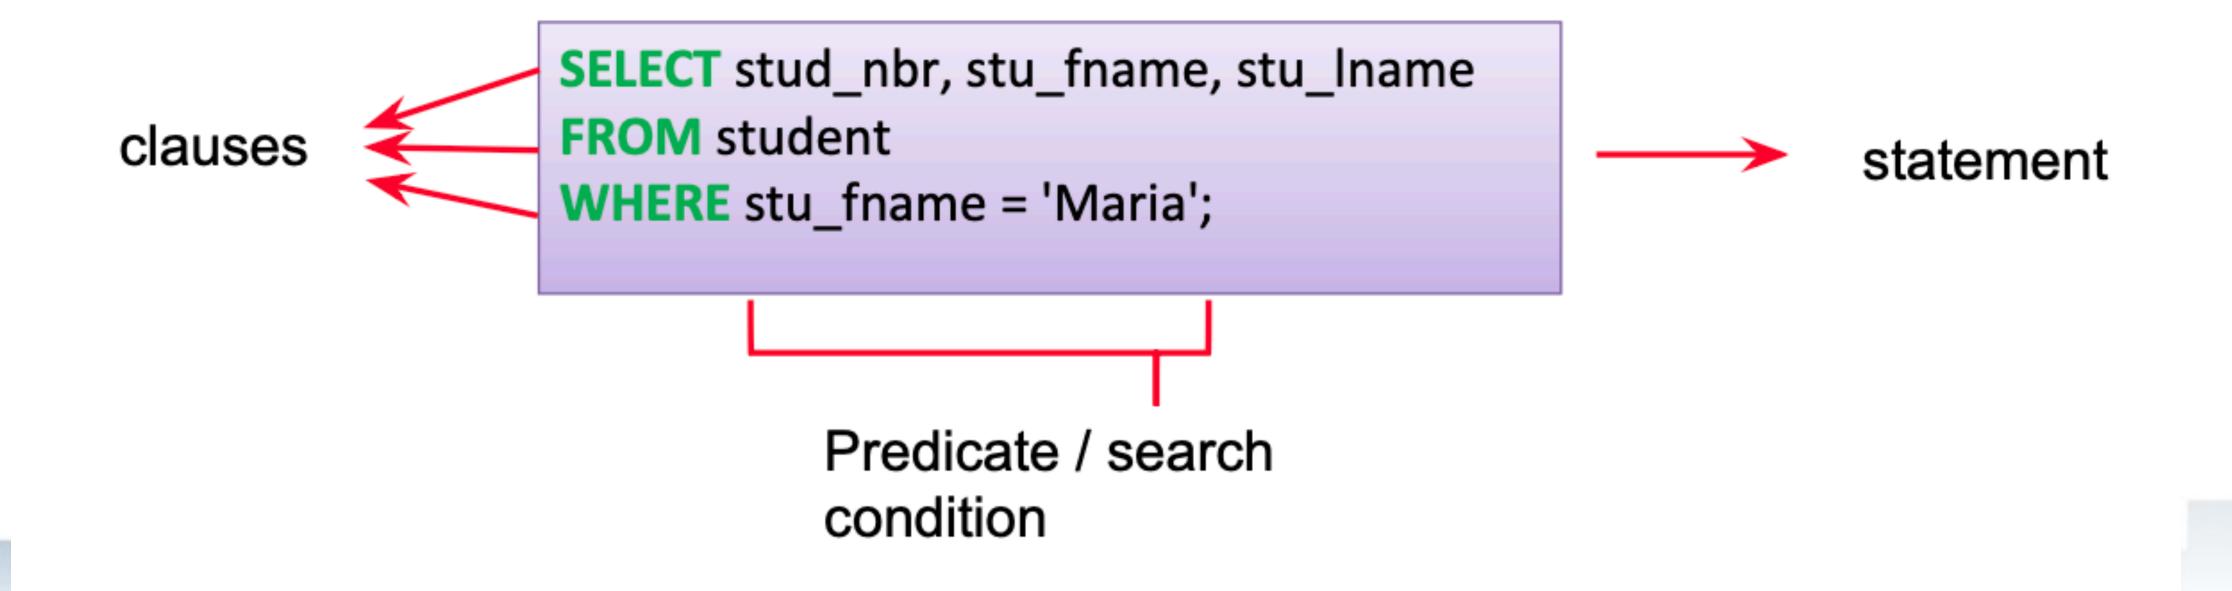

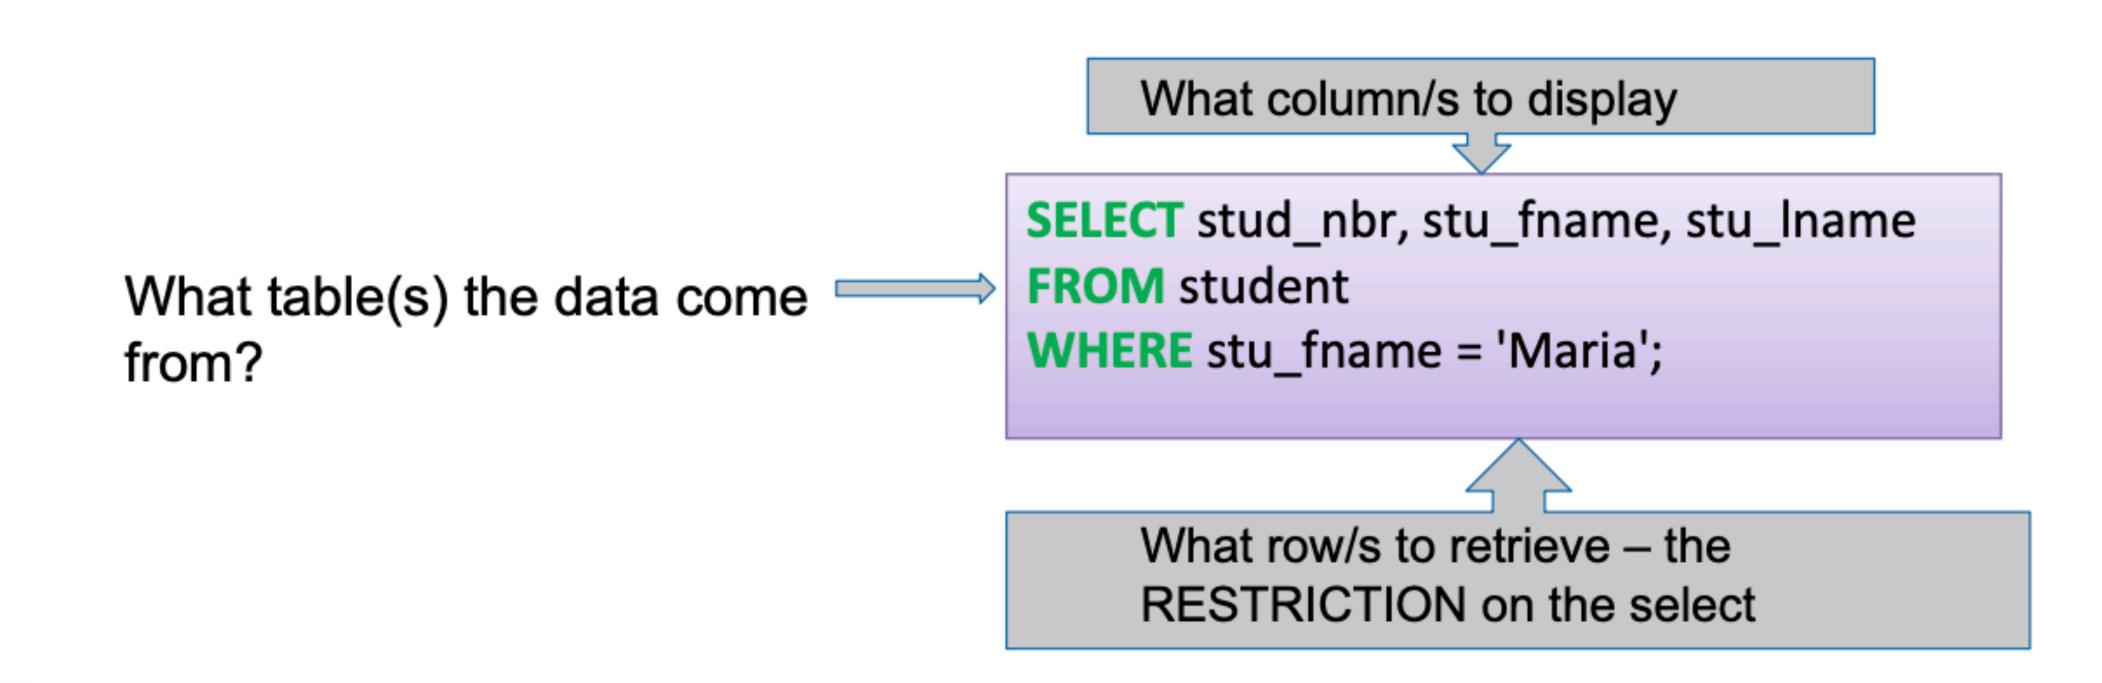

- 可以阅读图形形式的关系数据库
- 可以对单个表格进行简单SQL语句操作
- 可以通过不同类型的JOIN对多个表格的数据进行SQL语句 操作
- 可以书写基于不同条件的SQL SELECT语句选择数据
- 可以书写SQL SELECT语句从多个表格中获取数据
- 可以正确的使用ORACLE date数据类型
- 可以给表格或列赋予昵称
- 可以给获取的数据进行排序

- 可以阅读图形形式的关系数据库
- 可以对单个表格进行简单SQL语句操作
- 可以通过不同类型的JOIN对多个表格的数据进行SQL语句 操作
- 可以书写基于不同条件的SQL SELECT语句选择数据
- 可以书写SQL SELECT语句从多个表格中获取数据
- 可以正确的使用ORACLE date数据类型
- 可以给表格或列赋予昵称
- 可以给获取的数据进行排序

Anatomy of an SQL SELECT statement

SQL SELECT statement - Usage

SQL Predicates or Search Conditions

 The search conditions are applied on each row, and the row is returned if the search conditions are evaluated to be TRUE for that row.

Comparison

- Compare the value of one expression to the value of another expression.
- Operators: =, !=,< >, <, >, <=, >=
- Example: salary > 5000

Range

- Test whether the value of an expression falls within a specified range of values.
- Operator: BETWEEN
- Example: salary BETWEEN 1000 AND 3000 (both are inclusive)

SQL Predicates or Search Conditions

Set Membership

- To test whether the value of expression equals one of a set of values.
- Operator: IN
- Example : city IN ('Melbourne', 'Sydney')

Pattern Match

- To test whether a string (text) matches a specified pattern.
- Operator: LIKE
- Patterns:
 - % character represents any sequence of zero or more character.
 - character represents any single character.
- Example:
 - WHERE city LIKE 'M%'
 - WHERE unit_code LIKE 'FIT20__'

SQL Predicates or Search Conditions

- NULL

- To test whether a column has a NULL (unknown) value.
- Example: WHERE grade IS NULL.
- Use in subquery (to be discussed in the future)
 - ANY, ALL
 - EXISTS

What row will be retrieved?

- Predicate evaluation is done using three-valued logic.
 - TRUE, FALSE and UNKNOWN
- DBMS will evaluate the predicate against each row.
- Row that is evaluated to be TRUE will be retrieved.
- NULL is considered to be UNKNOWN.

Q1. Consider the predicate "enrol_mark >= 50", what row(s) will be selected for this predicate by the DBMS?

	♦ STU_NBR	♦ UNIT_CODE	⊕ ENROL_YEAR	⊕ ENROL_SEMESTER	⊕ ENROL_MARK	⊕ ENROL_GRADE
1	11111111	FIT1001	2012	1	78	D
2	11111111	FIT1002	2013	1	(null)	(null)
3	11111111	FIT1004	2013	1	(null)	(null)
4	11111112	FIT1001	2012	1	35	N
5	11111112	FIT1001	2013	1	(null)	(null)
6	11111113	FIT1001	2012	2	65	С
7	11111113	FIT1004	2013	1	(null)	(null)
8	11111114	FIT1004	2013	1	(null)	(null)

- 1, 4 and 6 a.
- b. All rows
- 1 and 6
- All rows except row 4

Combining Predicates

- Logical operators
 - AND, OR, NOT
- Rules:
 - An expression is evaluated LEFT to RIGHT
 - Sub-expression in brackets are evaluated first
 - NOTs are evaluated before AND and OR
 - ANDs are evaluated before OR
 - Use of BRACKETS better alternative

Truth Table

- AND is evaluated to be TRUE if and only if **both** conditions are TRUE
- OR is evaluated to be TRUE if and only if at least one of the conditions is TRUE

AND			
AB	T	U	F
Т	Т	U	F
U	U	U	F

F

OR	OR				
AB	T	U	F		
Т	T	T	T		
U	Т	U	U		
F	T	U	F		

T = TRUEF = FALSEU = Unknown

F

Q2. What row will be retrieved when the WHERE clause predicate is written as

	V_CODE	
1	21344	
2	20001	
3	24288	
4	20001	
5	24288	

1,3,5 a.

3,5

No rows will be retrieved

Q3. What row will be retrieved when the WHERE clause predicate is written as

V	CO	DE
_		

21344

20001

24288

20001

24288

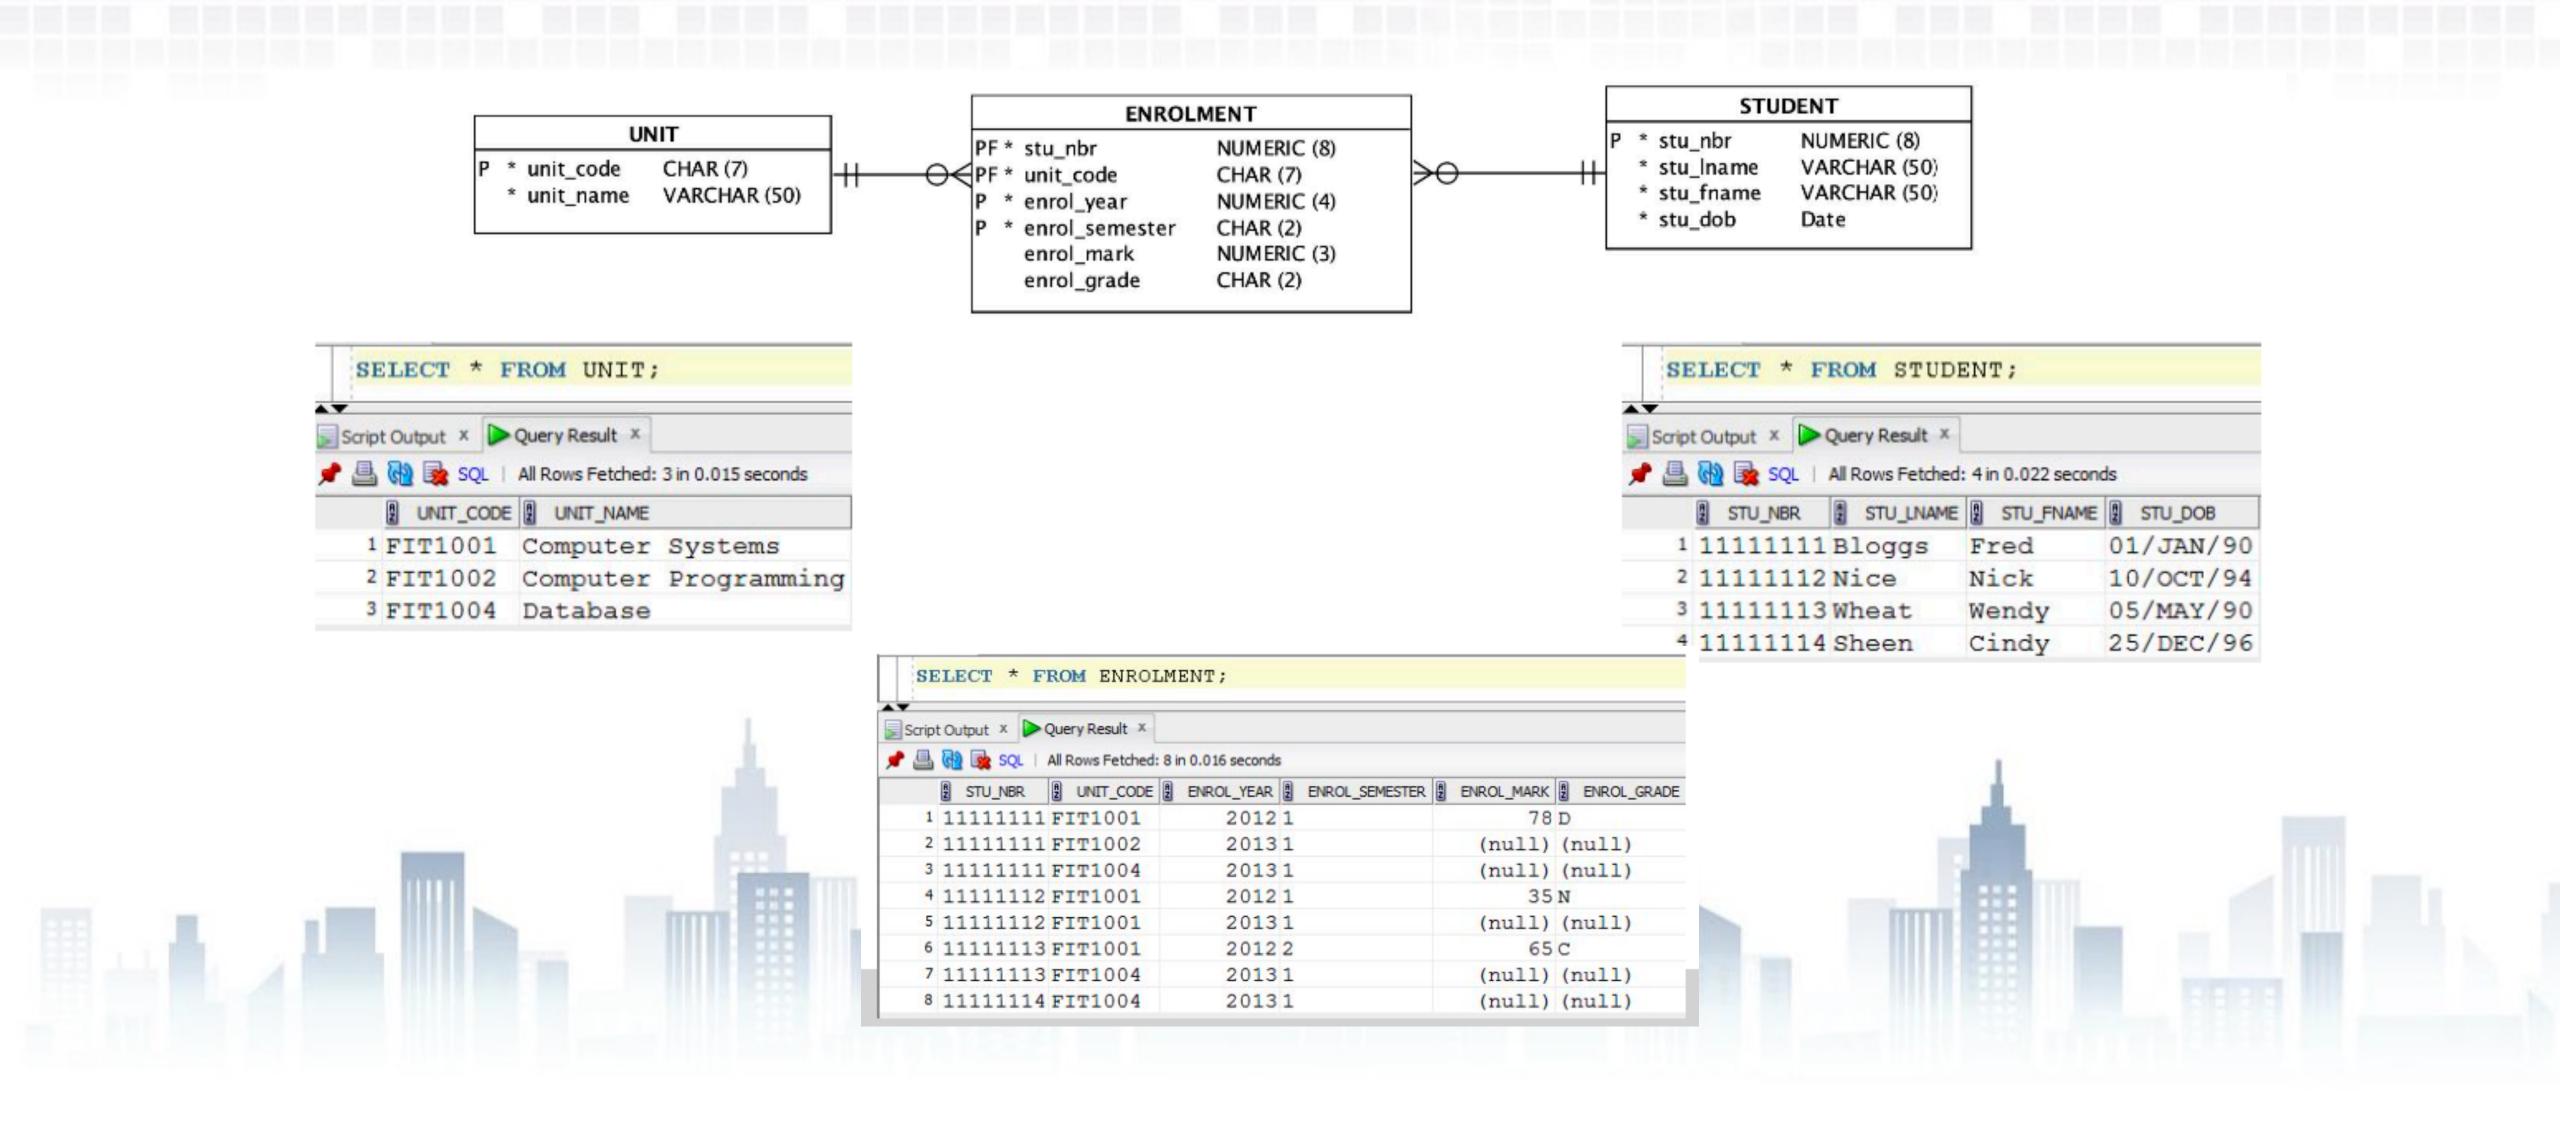

2,4 b.

3,5

d. 1,2,3,4,5

Lecture

Q4. What is the correct SQL predicate to retrieve those students who have passed and also those students who have not been awarded any mark?

	\$ STU_NBR \$ UNIT_C	CODE & ENROL_YEAR	ENROL_SEMESTER	⊕ ENROL_MARK	⊕ ENROL_GRADE
1	11111111 FIT1001	2012	1	78	D
2	11111111 FIT1002	2013	1	(null)	(null)
3	11111111 FIT1004	2013	1	(null)	(null)
4	11111112 FIT1001	2012	1	35	N
5	11111112 FIT1001	2013	1	(null)	(null)
6	11111113 FIT1001	2012	2	65	С
7	11111113 FIT1004	2013	1	(null)	(null)
8	11111114 FIT1004	2013	1	(null)	(null)

- enrol mark >= 50 AND enrol mark IS NULL a.
- enrol mark >= 50 OR enrol mark IS NULL
- enrol mark >= 50 AND enrol mark IS NOT NULL
- enrol mark >= 50 OR enrol mark IS NOT NULL
- None of the above

Arithmetic Operations

- Can be performed in SQL.
- For example:

SELECT stu_nbr, enrol_mark/10 **FROM** enrolment;

	STU_NBR	ENROL_MARK/10
1	11111111	7.8
2	11111111	(null)
3	11111111	(null)
4	11111112	3.5
5	11111112	(null)
6	11111113	6.5
7	11111113	(null)
8	11111114	(null)

Oracle NVL function

It is used to replace a NULL with a value.

```
SELECT stu_nbr,
 NVL(enrol_mark,0),
 NVL(enrol_grade,'WH')
FROM enrolment;
```

	♦ STU_NBR	NVL(ENROL_MARK,0)	♦ NVL(ENROL_GRADE, 'WH')
1	11111111	78	D
2	11111111	0	WH
3	11111111	0	WH
4	11111112	35	N
5	11111112	0	WH
6	11111113	65	C
7	11111113	0	WH
8	11111114	0	WH

Renaming Column

- Note column headings on slide 16
- Use the word "AS"
 - New column name in " " to maintain case or spacing
- Example

SELECT stu_nbr, enrol_mark/10 AS new_mark FROM enrolment;

SELECT stu_nbr, enrol_mark/10 AS "New Mark" FROM enrolment;

Sorting Query Result

- "ORDER BY" clause tuples have no order
 - Must be used if more than one row may be returned
- Order can be ASCending or DESCending. The default is ASCending.
 - NULL values can be explicitly placed first/last using "NULLS" LAST" or "NULLS FIRST" command
- Sorting can be done for multiple columns.
 - order of the sorting is specified for each column.
- Example:

SELECT stu_nbr, enrol_mark FROM enrolment ORDER BY enrol_mark DESC

	STU_NBR	
1	11111111	(null)
2	11111111	(null)
3	11111114	(null)
4	11111112	(null)
5	11111113	(null)
6	11111111	78
7	11111113	65
8	11111112	35

Q5. What will be the output of the following SQL statement?

SELECT stu_nbr FROM enrolment WHERE enrol_mark IS NULL;

		⊕ UNIT_CODE	⊕ ENROL_YEAR	⊕ ENROL_SEMESTER	⊕ ENROL_MARK	♦ ENROL_GRADE
1	11111111	FIT1001	2012	1	78	D
2	11111111	FIT1002	2013	1	(null)	(null)
3	11111111	FIT1004	2013	1	(null)	(null)
4	11111112	FIT1001	2012	1	35	N
5	11111112	FIT1001	2013	1	(null)	(null)
6	11111113	FIT1001	2012	2	65	С
7	11111113	FIT1004	2013	1	(null)	(null)
8	11111114	FIT1004	2013	1	(null)	(null)

a.

1111111
11111112
11111113
11111114

b.

1111111
1111111
11111112
1111113
1111114

11111111 11111112 11111113

Removing Duplicate Rows in the Query Result

- Use "DISTINCT" as part of SELECT clause
- use with care

SELECT **DISTINCT** stu_nbr FROM enrolment WHERE enrol_mark IS NULL;

-	♦ STU_NBR
1	11111114
2	11111111
3	11111112
4	11111113

Lecture

SQL NATURAL JOIN

STUDENT

sno	name
1	alex
2	maria
3	bob

QUALIFICATION

sno	degree	year
1	bachelor	1990
1	master	2000
2	PhD	2001

SELECT* FROM student JOIN qualification ON student.sno = qualification.sno **ORDER BY student.sno**

sno	name	degree	year
1	alex	bachelor	1990
1	alex	master	2000
2	maria	PhD	2001

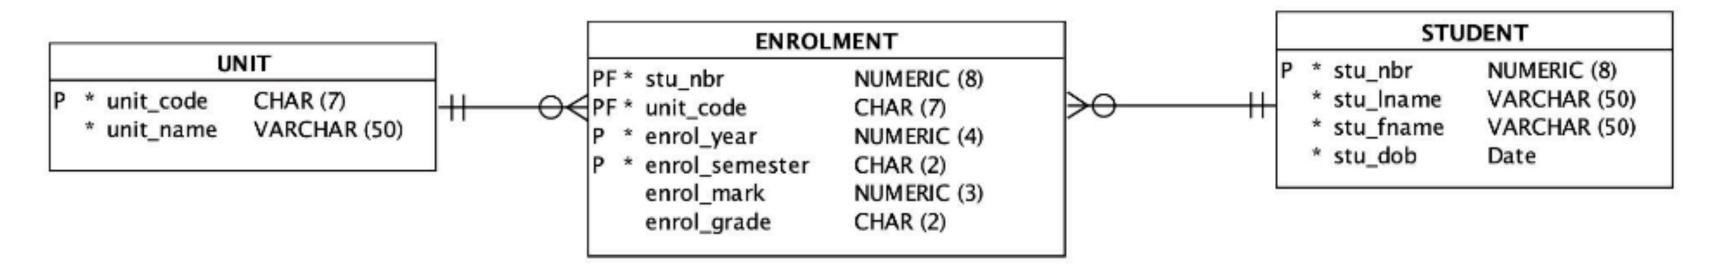

SQL JOIN

- For database students are required to use ANSI JOINS
 - placing the join in the where clause is not acceptable and will be marked as incorrect for all assessment purposes
 - such a join is sometimes known as "implicit join notation" effectively a cross product and then restricted by the where clause
- ANSI JOINS
 - ON
 - the general form which always works, hence the syntax we tend to use
 - FROM student JOIN qualification ON student.sno = qualification.sno
 - USING
 - requires matching attribute names for the PK and FK
 - FROM student JOIN qualification USING (sno)
 - NATURAL
 - requires matching attribute names for the PK and FK
 - FROM student NATURAL JOIN qualification

JOIN-ing Multiple Tables

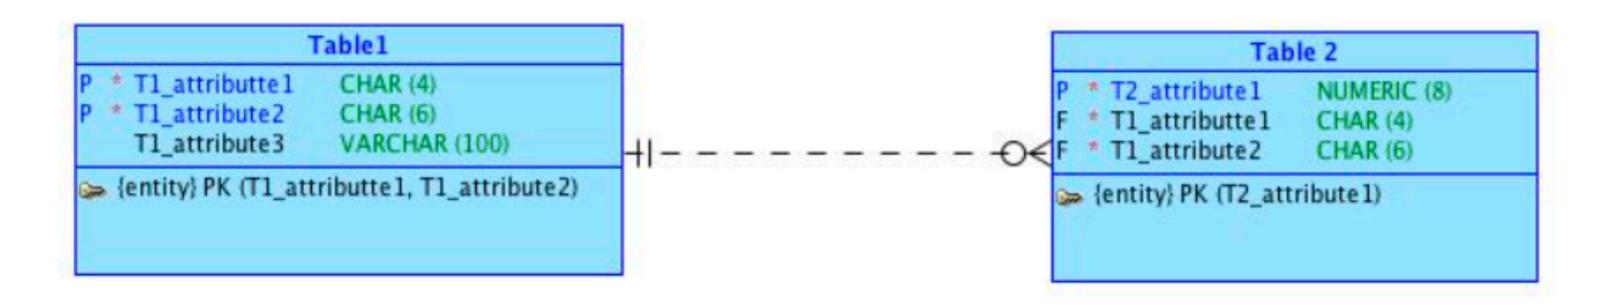

Pair the PK and FK in the JOIN condition Note table aliasing e.g. unit u in FROM clause

SELECT s.stu_nbr, s.stu_lname, u.unit_name FROM ((unit u JOIN enrolment e ON u.unit_code=e.unit_code) JOIN student s ON e.stu_nbr=s.stu_nbr) ORDER BY s.stu_nbr, u.unit_name;

How many conditions will be used to join the two tables?

```
SELECT *
FROM table1 t1 JOIN table2 t2 ON
    (t1.T1_attribute1 = t2.T1_attribute1
     AND
     t1.T1_attribute2 = t2.T1_attribute2)
ORDER BY t1.T1_attribute1, t1.T1_attribute2;
```

Summary

- SQL statement, clause, predicate.
- Writing SQL predicates.
 - Comparison, range, set membership, pattern matching, is NULL
 - Combining predicates using logic operators (AND, OR, NOT)
- Arithmetic operation.
 - NVL function
- Column alias.
- Ordering (Sorting) result.
- Removing duplicate rows.
- JOIN-ing tables

Oracle Date Datatype

- Dates are stored differently from the SQL standard
 - standard uses two different types: date and time
 - Oracle uses one type: DATE
 - Stored in internal format contains date and time
 - Julian date as number (can use arithmetic)
 - Output is controlled by formatting
 - select to_char(sysdate,'dd-Mon-yyyy') from dual; » 04-May-2020
 - select

```
to_char(sysdate,'dd-Mon-yyyy hh:mi:ss PM') from
dual;
```

» 04-May-2020 02:51:24 PM

- DATE data type should be formatted with **TO_CHAR** when selecting for **display**.
- Text representing date must be formatted with TO_DATE when comparing or inserting/updating.
- Example:

```
select studid,
   studfname || ' ' || studlname as StudentName,
   to char(studdob,'dd-Mon-yyyy') as StudentDOB
from uni.student
where studdob > to date('01-Apr-1991','dd-Mon-yyyy')
order by studdob;
```

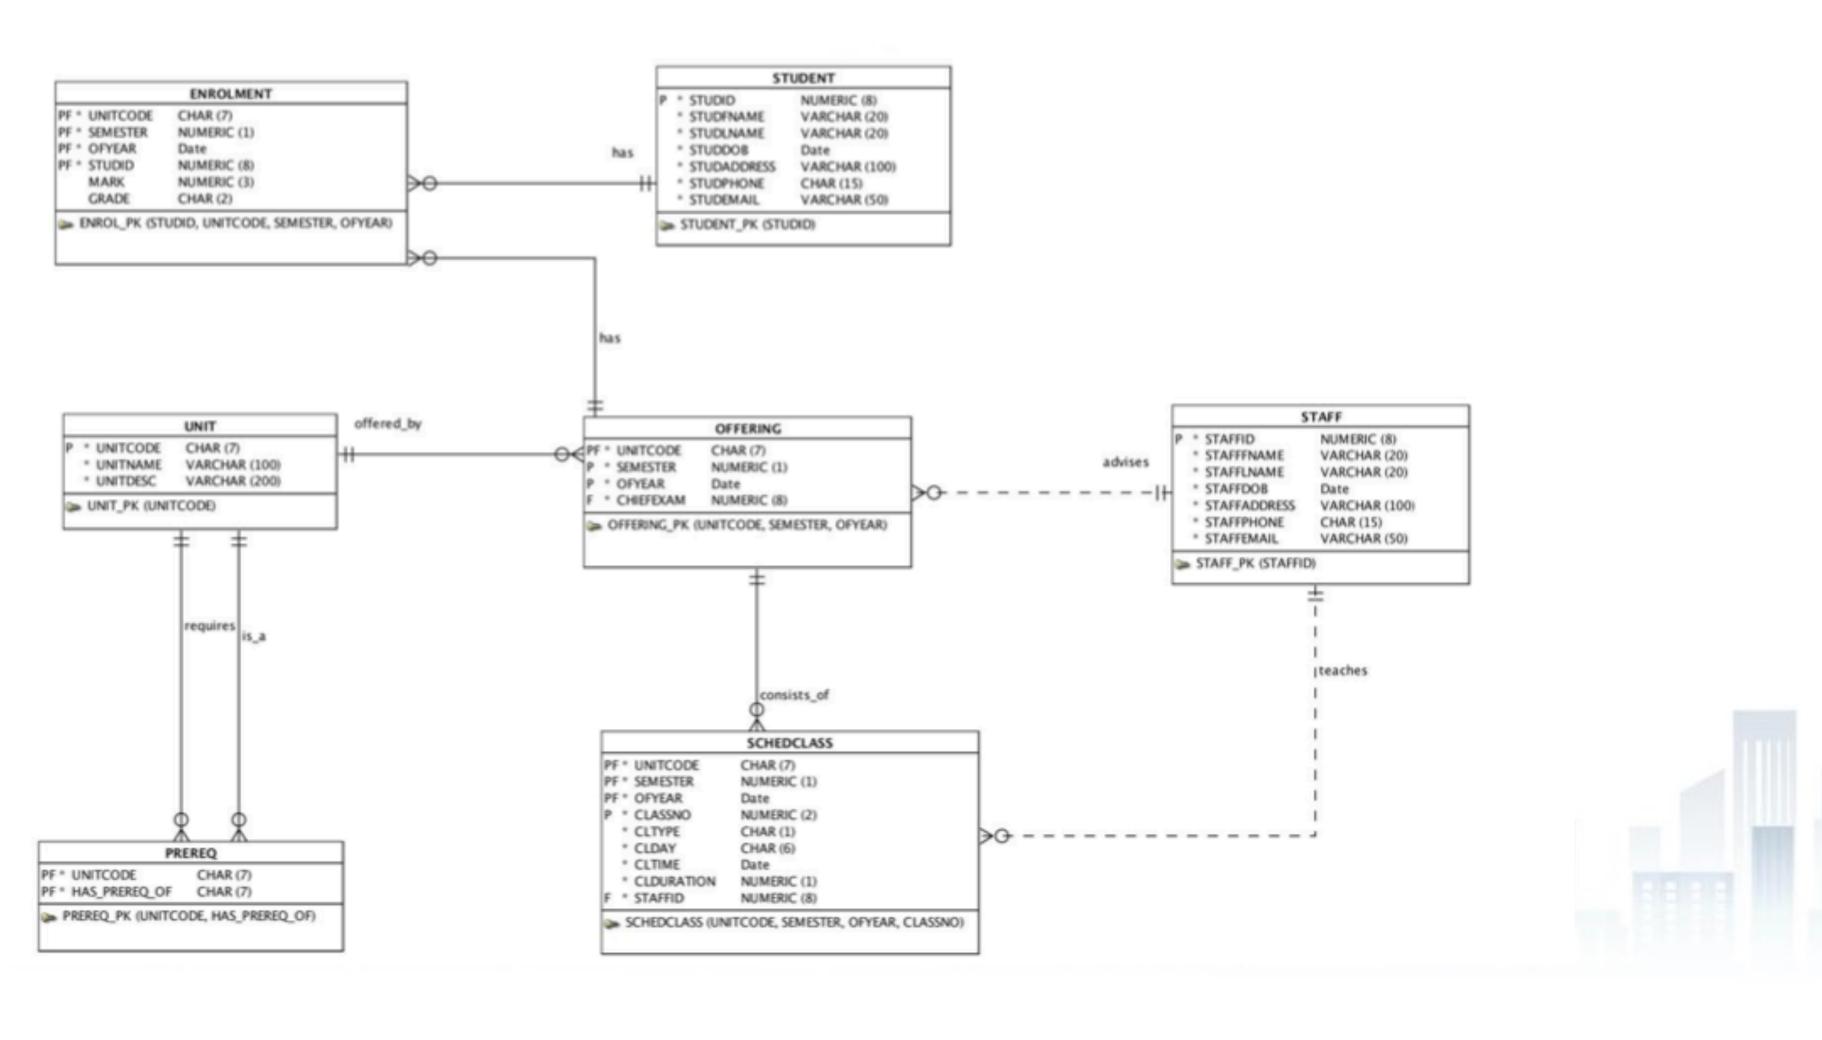

Current Date

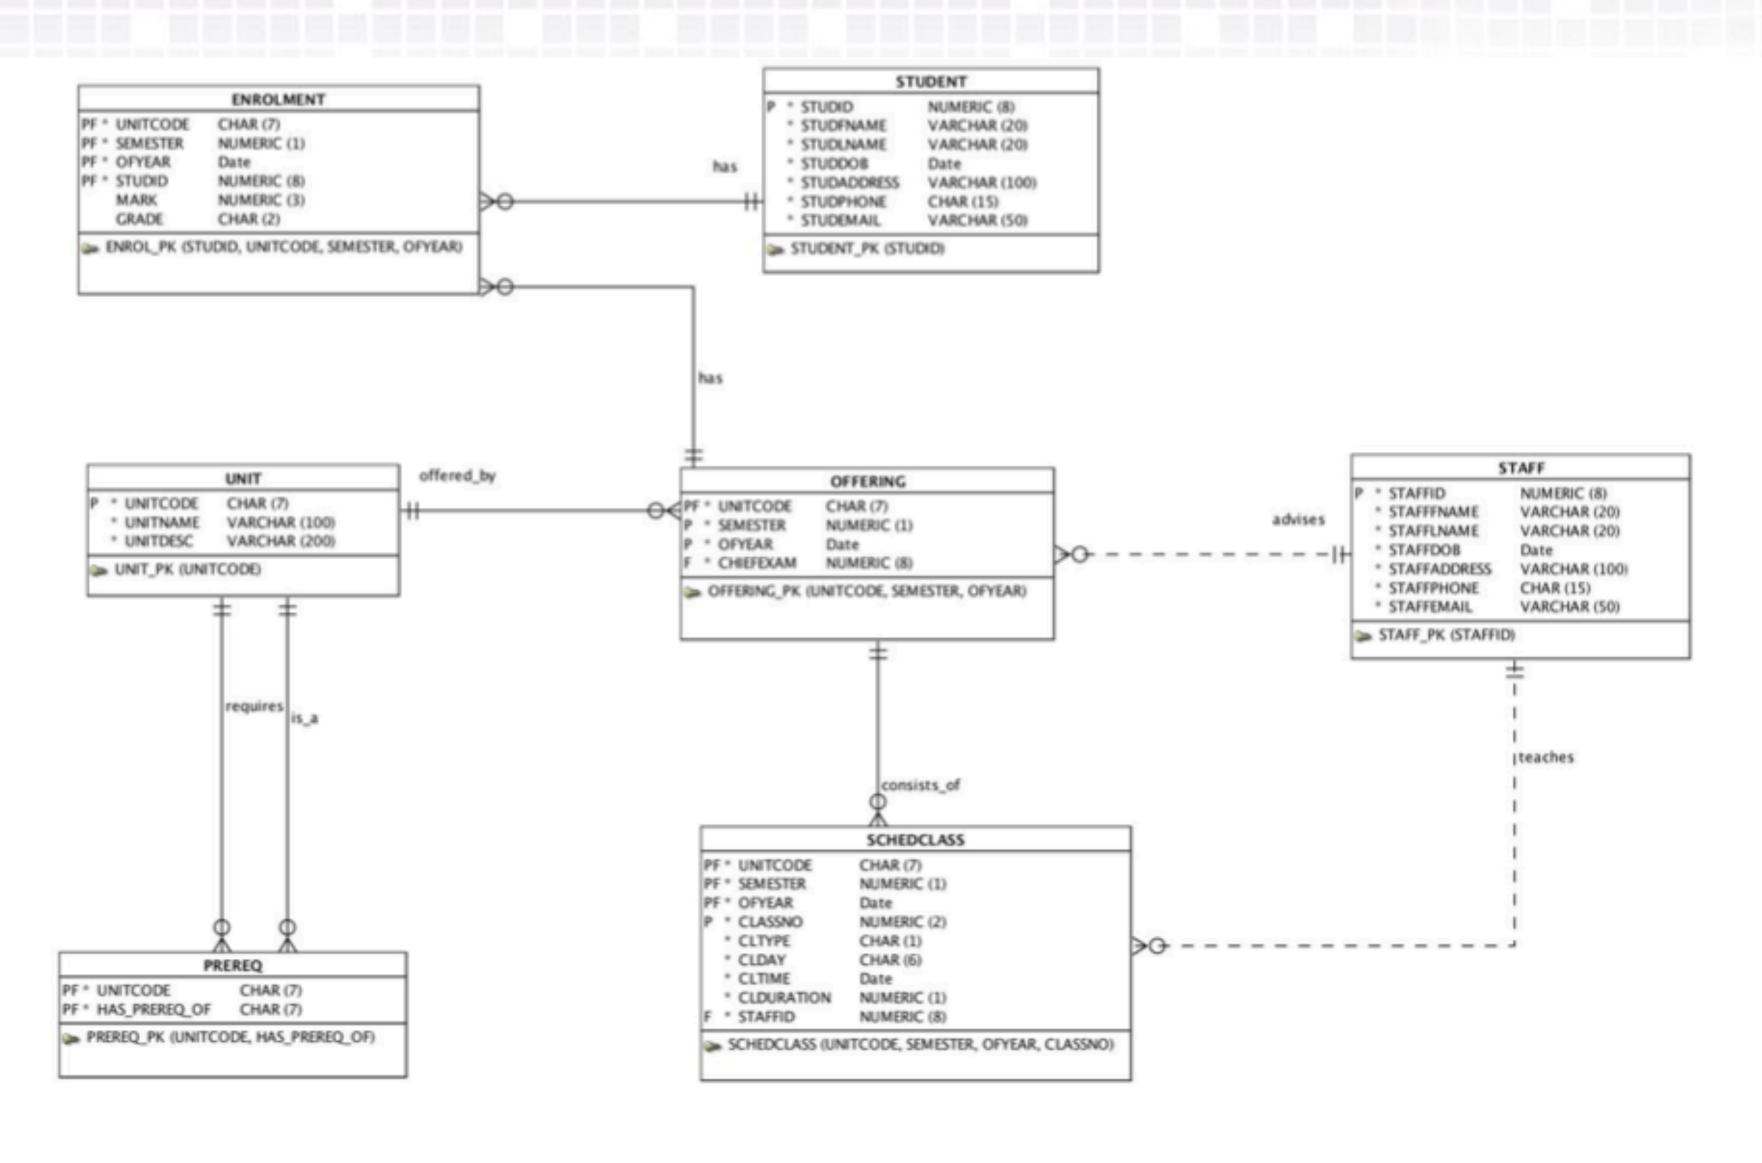

- Current date can be queried from the DUAL table using the SYSDATE attribute.
 - SELECT sysdate FROM dual;
- Oracle internal attributes include:
 - sysdate: current date/time
 - systimestamp: current date/time as a timestamp
 - user: current logged in user

Uni Data Model

Q1: Show the ids, names of students as a single column called NAME and their DOBs. Order the output in date of birth order.

Q2: Show the ids, names of students as a single column called NAME, unit code, and year and semester of enrollment where the mark is NULL. Order the output by student id, within unit code order.
